>Bernie, WR3E.

You have noticed a common usenet problem... some 20.000 newsgroups
were created for discussion about many different topics, yet some
people cannot be bothered to check if their posting matches the topic
of the newsgroup before posting.
The result is often called "noise", and the "signal/noise ratio" of a
newsgroup can be varying, much like the s/n ratio when receiving a DX
station.

Then there are those loud mouth postings, like Dave's. Those guys want
to let the world know they have something *very important* to tell, and
post it in as many newsgroups they can think of. Those postings are
allmost certainly off-topic.

I'm afraid it is difficult to overcome. You will just have to live
with it, and select news software that allows you to quickly skim
articles to see if they are in the "signal" or in the "noise" category.
Some news software will also allow you to automatically skip articles
that are posted to many newsgroups. That will help you to avoid some
of the utter garbage (like "visit my page!" or "make money fast!").

73,
Rob

Does anyone have one of these ancient beasties? I've just come across one and am thinking of keeping it for nostalgia's sake. Any comments on the receiver, hints/tips on keeping it up to scratch/realigning it.

Is there an Eddystone users group? Does anyone sell the manual for it or, better still, a workshop manual?

All hints & tips welcome.

Thanks in anticipation.

73 Bob

Date: 1996-08-02 00:00:00 UTC
From: gfiber@halcyon.com
Message-ID: <4trrpj$7te@news.halcyon.com>
Source record: 196628

This mighe help you with your IC-735. I strongly suspect the 22 to 30 MHz VCO is out of lock.

Gary

Most Common Failures and Cures for the Icom IC-735

Symptom: Erratic display, segments missing from frequency display. Radio seems to work OK otherwise.
Probable Cause: Bad solder at IC1 display driver on display unit.
Cure: Resolder pins on IC1.
Remarks: IC1 is a surface mount IC.

Symptom: Intermittent RX/TX. Intermittent high SWR. Seems like antenna is intermittent.
Probable Cause: Cracked solder joint at antenna connector.
Cure: Resolder joint at antenna connector where it connects to the filter unit. We recommend replacing the thin wire between the filter unit and antenna connector with a thicker wire to prevent future failure.

Symptom: Intermittent RX. Seems like antenna is disconnected in receive mode. TX is OK.
Probable Cause: Cracked solder at external RX phono jack on main unit.
Cure: Resolder phono jack to main unit.

Symptom: No TX, or low TX output on one or more bands with high current draw from power supply. Other bands are OK.
Probable Cause: Damaged components in low-pass filter.
Cure: Replace all obviously burned/overheated components on filter unit. Also inspect PA for overheating.

Symptom: Power drops off as unit warms up. ALC meter deflection remains high.
Probable Cause: APC out of alignment.
Cure: Follow APC alignment procedures in the service manual. (R262 on main unit.)

Symptom: Distorted RX/TX, or no RX/TX on one or more bands. Distorted SSB audio sounds raspy and rough. Problem may be temperature related.
Probable Cause: Bad trimmer capacitors on PL unit, HPL VCO section.
Cure: Replace plastic trimmer capacitors C37, C45, C52, and C59 with ceramic equivalents. Also replace the reference

oscillator trimmer C138.

Symptom: Frequency instability.
Probable Cause: Unstable plastic trimmer capacitor C138 on PL unit.
Cure: Replace C138 with a ceramic equivalent. We also recommend replacing the HPL trimmers at this time.

Symptom: Intermittent mic audio.
Probable Cause: Dirty mic gain control.
Cure: Spray-clean control with Blue Showers solvent.
Remarks: Using a cleaning solvent other than Blue Showers may cause damage by removing a substance inside the control that allows smooth movement of the slider.

Symptom: VFO tuning is erratic, sometimes lags or skips when changing frequencies or bands. Sometimes least-significant digit in frequency display "flutters" back and forth instead of changing incrementally when the VFO knob is turned slowly.
Probable Cause: Bad rotary encoder.
Cure: Substitute rotary encoder with a known good one. It is recommended that the rotary encoder be replaced as a complete assembly if it is bad.
Remarks: If the frequency tunes in only one direction, i.e. either up or down, there may be a problem on the logic unit.

Symptom: Mic gain is low when using Heil microphone element.
Cure: Change value of R235 on PL unit to 200k.

Symptom: Radio trips/shuts down power supply when power connector is plugged in, even when radio is turned off.
Probable Cause: Shorted PA transistors.
Cure: Replace shorted PA transistors. The pre-driver and driver transistors are probably bad too. Check electrolytic capacitors C25 and C29 on PA unit for swelling and replace if needed.

Symptom: Drastic change in audio frequency response between USB and LSB., i.e. USB audio has too much bass while LSB audio has too much treble. USB/LSB RX frequency response may be equalized, to a degree, by adjustment of the front panel PBT control. TX frequency response remains poor.
Probable Causes: Misadjustment of the BFO and/or PBT shift oscillator, or bad FL-30 on main unit.
Cure: Realign the BFO and PBT shift oscillator. If this doesn't help, replace the FL-30.
Remarks: Some filters are better than others so some test selection may be needed to satisfactorily alleviate the problem. The better-performing (but more expensive) FL-80

filter can be substituted for the FL-30.

Symptom: "Chirp" in CW operation.
Probable Causes: 1) Low power supply voltage in TX. 2) Astron power supply needs additional RF decoupling. 3) Early production IC-735 needs factory update.
Cure: Check power supply voltage at pin 7 of either accessory jack in TX mode. It should not vary excessively from RX standby voltage or drop below 12 volts. If an Astron power supply is being used with radio, install additional RF decoupling capacitors to its output terminals. If the IC-735 is an early production unit, it may need a factory update to prevent chirp. Call Icom Technical Support for update information.

Symptom: Harsh-sounding or extremely rough-sounding mic audio when used on either antenna or dummy load. Average SSB output seems low; must increase mic gain to a high level for proper TX output. RX and FM TX are OK.
Probable Cause: Driver and PA idle current is low.
Cure: Align driver and PA idle current to specs: 100mA for driver, 600mA for PA. If the PA idle current will not adjust up to specs, Q4, D2, or D3, may be bad. If the PA idle current is erratic, there is probably a cracked joint at Q4 or D2. If driver idle current will not quite adjust up to specs, install field mod: Decrease value of R18 on PA unit from 120 ohms to 68 ohms, or simply, piggyback another 120 ohm resistor across R18.

Symptom: Raspy-sounding mic audio when used on antenna. Radio sounds good when transmitting into dummy load. Power output seems normal. May be complaints of RFI.
Probable Causes: 1) Station ground is in adequate. 2) Astron power supply used with unit needs additional RF decoupling. 3) RF feedback in mic circuit.
Cure: Check station ground. If an Astron power supply is being used with radio, install additional decoupling capacitors across output terminals. Short pins 6 & 7 in microphone connector to remove RF feedback.
Remarks: If nothing helps, radio should be checked for spurious output. (see below)

Symptom: Spurious TX on some bands. SWR reading may be high when transmitting into a dummy load. Power is low on some bands. Ic may be high.
Probable Cause: Bad components on PA unit caused by over-voltage or overheating.
Cure: Check and replace as needed: C25 & C29 (1000uF, 16v) and R25 (4.7 ohm, 2 watt) on PA unit. Also look for overheated components and solder joints on the L4 assembly.

Symptom: No display, no RX/TX. Inspection reveals PLL
unlock.
Probable Causes: 1) Low power supply voltage. 2) Bad IC8
on PL unit.
Cure: Measure power supply voltage at pin 7 of either
accessory jack. Should be not less than 12 volts for
reliable operation. If OK, replace IC8 on PL unit.

Symptom: No RX/TX when cold or warm. May have dead spots
in tuning range of each band.
Probable Cause: PLL unlock.
Cure: Align LPL lock voltage on PL unit.

Symptom: Frequency unstable in TX on 10 meters, especially
after warm-up.
Probable Cause: PL unit needs factory update.
Cure: On PL unit, change value of R163 from 3.3k to 1.5k,
and spread coil L36.

1956. Re: BNC loose on the Yaesu FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-02 00:00:00 UTC
From: KB2UFS@gnn.com
Message-ID: <4ts5ph$l3c@news-e2d.gnn.com>
Source record: 196629

I have had the same thing happen with my FT51R. The first few times I tried to tighten the external retaining ring around the base of the BNC. Not having the right spanner wrench, I used needle-nosed pliers. That chopped up the ring a bit, and it still loosened up within a few days. Then I noticed that although the BNC had rotated, the radio was still able to transmit and receive. Wondering why the center conductor had not broken free internally, I opened up the 51R. I was relieved to find that the center conductor was held in a four-fingered spring retainer that *allows for rotation* without losing contact! (However, it seems to me that somewhere on this net I read of someone having to solder this connection to eliminate intermittents--I have not had this problem, so far.) Now, still lacking the correct spanner wrench, I gave the BNC itself a twist until it was secure. In the field, I have tightened it using the base of the attached rubber duck to torque it--probably not good for the duck!. At home, I *carefully* catch the BNC's two pins in the jaws of a plier, one with ribs large enough to engage the pins without having to squeeze the BNC too hard, and tighten it. After the second time with the pliers trick, the BNC has held fast. I hope this helps.

By the way, keep an eye on that tuning knob! Mine is always falling off. I was told, on this net, that Yaesu will replace it with a redesigned one if it is a problem.

Kirk,

Try http://members.gnn.com/hca/ft50/index.htm, the unofficial web page for the FT50. I saw a post there recommending the use of the belt clip from Yaesu's "Vertex" line of commercial radios. The current Vertex radios appear to be the same as the FT10, 40, and 50, except for different keypads and accessories. You might want to visit the Vertex web page next at http://www.yaesu.com/vertex/vertex.html. Hope this helps.

Sounds like a Lot of CRAP to say nothing....

If you don't want every idiot to know your business <ph number> or whatever, thats your thing.

But it still doesn't answer the persons question....

The simple answer is to: run a line from the phone co side of the blocker straight to the phone or simply disconnect while using the modem. Then ADD *67 to the dialing entry followed by a comma then the number to dial.... Some call blockers use loop current to determine when to send the tones <*67>, by connecting to the Central office side of them <Phone line side> you can bypass them...

Having worked for the phone co. in FL. for years, only 2 groups of people really wanted to know who was calling...

Cops an Dope Dealers... They both have to look over their shoulder a lot... An should too!

BTW> There is available a device which can overide the maw-bell - info for user programmable info. It will send out anything you want it to, from ""UNKNOWN"" to ???? I like unknown better... It keeps them wondering, or if you want program it send the local direct line to the Det. Bur. or something similar...

There is "NO" number safe from anyone with phone company connections..!

You might want to look into getting the software to program it off your PC. It works great and you can clear up any of those unwanted memories. Also, you can keep memory list for those places that you travel to, so that you can reload and go. It works great!

This mint transceiver is being offered for sale because I just acquired an Icom 775DSP and good stewardship of my $ dictates I check the market. The Kenwood TS-950SD is widely known for its being a world class transceiver. This one has been mine since it was made and has always been in a smoke free environment. If you are unfamiliar with the radio I will briefly share that it is a 160-10 meter HF 150 watt output transceiver and has general coverage receive from 100kHz-30MHz. Antenna tuner, electronic keyer, RF speech processor, dual VFOs and digital signal processing are all built in.
Mine also includes the MC-60 Desk Mic, Kenwood hand mic, and the SP-930 Audio Filtering External Speaker.
Price is $2,200 picked up in Charlotte, NC or + shipping to your QTH. My email address is WD4R@aol.com

The tape trick doesn't really work removes contrast and clarity. If you should be unfortunate to get a scratch on your HT (or anything plastic), get Novus Plastic Polish. I use #2 for fine scratches. Or get #1 too, for worse condition displays.

1973. FT50 huge birdy and more

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-02 00:00:00 UTC
From: trop@alantec.com
Message-ID: <4turkb$egc@irvin.alantec.com>
Source record: 196646

Netlanders,

Last week I asked if anyone else was having trouble scanning
between 590 and 650 MHz. Two of four responses were positive.

Since then I have discovered that the problem is actually
larger. I am unable to scan any frequency within the
Wide FM arena.

Further, reception of signals in the 590-650+ region is
nil. My Icom 2SRA receives signals full scale while
the ft50 receives nothing.

AM and NFM scanning appear to be OK.

I'm pretty sure that I've found birdies in the 155MHz region
also.

Yaesu did not know of any problems in the 590 region, but
did admit there was a repair of a known birdy @ 146MHz.

they also state that there is an error in the manual
regarding the FTT12 DVR. New manuals are being printed.

There is currently no word from Japan on a fix for the
known to narrow WFM problem.

I'd like to hear from anyone else with regards to how
their unit works.

Thanks....

>BPF FOR 22-30Mhz PROBLEM???? TRANSMITS FINE ON ALL BANDS
> TNX 73

Look at IC2 pins 1-7. They select the proper BPF for each segment.
The pin with 13.8 volts on it selects the active filter, all the
others should show 0 volts. If one of the pins always shows 0 volts
as you tune through the various bands, IC2 may be bad. Pin 7 is
the one which selects the BPF you suspect isn't being activated.
Pin 10 of IC2 is the signal which drives pin 7, so check here
if pin 7 isn't toggling. If the signal on pin 10 isn't toggling
either, then IC2 is probably good and the problem is in the PL
unit. This would be IC9 pin 15. If it isn't toggling, then either
IC9 is bad, or the microprocessor has lost its mind. Since it
transmits, I'd suspect IC9 rather than the microprocessor, but
I'd really suspect IC2 more than either of those.

If all those signals are good, then you may have a bad switching
diode, or a cold solder joint in the BPF. I've had the latter
in one IC-735 I serviced. It's the very devil to locate this
sort of problem, so just reheat all the inductor joints in the
area if it comes down to this. You might try checking inductor
continuity with an ohmmeter first. The one I fixed tested open
until I reheated the joint. (The joint looked good, and I expect
the open was internal to the coil, but reheating fixed it.)

>diode(s) that others are having trouble with.
>My question now is can you put a larger value diode in to keep this
>from happening again?

If it is the filter switching diodes (D6 and D7 on the PA board),
then you can simply jumper them with buss wire. This is the crude
direct equivalent of the type 1 "yellow wire mod", and will permanently
solve the diode problem. These are tiny SMD dual diodes, you can't
fit larger diodes in their place.

The downside is that they will no longer blow and protect the preamp
IC from being fried. The better solution is to make sure not to feed
high levels of RF power into the VHF antenna connector, such as by
not mounting the 2m antenna right next to the HF antenna. Then the
diodes will live, and so will the preamp IC.

If you *have* to mount the VHF and HF antennas in very close
proximity, then put a bandpass filter between the VHF antenna
and the radio. The radio only has a low pass filter internally
before the diodes (the VHF transmit output network), and since
HF is a lower frequency than VHF, it'll pass nearly all of your
100 watts of HF signal right into those tiny little SMD diodes
and POOF, they're gone.

A *diplexer* used to combine the VHF and HF ports of the radio
for use with a single antenna has sufficient isolation to protect
the diodes. At least the Comet diplexer I'm using does. The various
helical and cavity IMD reduction bandpass filters offered on the
market should also have sufficient isolation to protect the radio
in the case of VHF and HF antennas in close proximity.

Several feet of antenna separation, especically *vertical* separation,
will also protect the diodes, and it won't require you to sacrifice
the general coverage VHF receive capabilities of the radio in the
process.

While the use of such tiny filter network switching diodes so close
to the radio's input is somewhat unique to this radio, blowing front
end components of a VHF radio whose antenna is mounted very close
to a moderately high power HF antenna is not. I've had preamp transistors
fried in other VHF rigs which were operated in a vehicle where the
VHF antenna was closely parallel with a HF rig antenna.

I don't know if this is what got your radio or not, but it is
something people should consider when mounting VHF and HF antennas
in close proximity.

>frequency up.

Ah, there's your (and Radio Shack's) mistake. You took *a* bandplan,
the one the ARRL publishes, and assumed it to be *the* bandplan. At
least in SERA country, channels in 144.5-144.6 MHz and 145.1-145.2 MHz

hold 5 repeater inputs and outputs, and aren't reserved for non-existent translator inputs and outputs. The FCC's bandplan, *the one that counts*, says we can use repeaters above 145.5 MHz, and most repeater coordinators' bandplans seem to agree. The ARRL keeps publishing their bandplan as if it were something in actual nationwide use instead of publishing the real bandplans used in various parts of the country. So this problem is mostly their fault. But still, RS should have done a bit more market research in this area.

Radio Shack should have set the cutoff at 145.5 MHz not 145.6 MHz. Their hearts were in the right place, but their knowledge of actual FM repeater bandplans around the country appears to have been lacking. Fortunately, they supplied a simple way to undo this mistake, so the radio isn't crippled.

That'd be across D15, Gary. That's not a bad idea. It's an old trick,
used by old timers to protect HF receivers, but it does have one drawback,
more IMD in high RF areas. There's no free lunch.

Gee, just drop into any neighborhood Radio Shack and ask the manager
to order you the service manual. It'll come to you direct mail. It
isn't expensive, and there's certainly no need to drive a hundred miles.

This same advice should be taken by most people looking for manuals
for their radios. TRY THE MANUFACTURER FIRST! Unless your radio is
long out of production, the manufacturer should still be selling
service manuals for it.

>before and what the fix is.

Gee, you won't void the warranty by removing the covers, looking
around, and taking some measurements. Now if you go at the main
board with a 300 watt American Beauty soldering iron, *that* might
void the warranty. :-)

Without putting too sharp a point on "Just Me"'s post, you *are*
a ham, you are expected to work on your own radios (within the
limits of your expertise). The amateur radio manufacturers know
that. They don't put seals on the covers to keep you out.

Do be careful, of course, and try not to get in too far over your
head. But you'll never learn if you don't *do*, so at least try.
If you do manage to void the warranty, consider it tuition.

The covers were off my IC-706 within an hour of its purchase. I
wanted to see how it worked (since Icom didn't see fit to include
a schematic, boo, hiss). That's the normal thing for a ham to do.
Icom had better know that.

OTOH, if you attempt a repair and butcher it (SMD is a bit tricky
at first, practice on scrap, not on a $1200 radio), Icom probably
will void your warranty. You had better know that.

That's right. Ordinary BNC (and N) connectors should be considered
assembly connectors. They aren't intended for thousands of cycles
of connecting and disconnecting. The female contacts lose their
spring and become intermittant, and the ear nubs on BNCs wear down
rapidly. While some scope vendors use BNCs made out of harder materials,
so the male connector wears down faster than the female, the only
connector which is really designed for repeated connection and
disconnection is the GR hermaphrodite connector (and that's a tad
big to use on a HT).

If you don't want problems, put the antenna on the HT and *leave* it
on the HT. Figure that the BNC just lets you replace a broken antenna
without soldering, nothing more.

It worked!!! Thanks a lot!!!

1988. A message about the Yeasu FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-02 00:00:00 UTC
From: reeds@northnet.org
Message-ID: <4triej$aun@zappa.northnet.org>
Source record: 196735

I recently purchased the above radio and would like to give it some praise and tell everybody about the problems I've had with it as well as describe some of the cool features.

PROBLEMS:

1) The BNC is easy to loosen. The antenna wiggles if you take it on and off too much.

2) There is no AC adapter in jack. You have to buy a little connector (EDC-12) that lets you use a lead acid battery or a car jack to give your radio power.

PRAISE:

1) The radio comes with a little charging stand that lets you carge the battery while using the radio with a different power supply (i.e. lead acid battery or AC adapter).

2) There are help scrolls that scroll by on the screen if you let it sit for a couple seconds that tells you what the menu you are looking at does. It is very handy for new comers to the radio that don't know what all the features do.

3) It displays that name of you memory at the same time that it displays the frequency that you are operating on.

4) Has a tone search so you can find what tone people are using and also so you can get into repeaters.

Well, that is what I have found about the FT-51R. If anyone has anthing else to add, please extend this thread. This newsgroup should have extensive reviews about radios so that people radio shopping can get opinions from other HAM's. I know that I could have used help in purchasing my radio and I assume that other HAM's would want to get help. Anyone that needs any help or would like opinions on this particular radio should write on this thread. Anyone who has a different radio and would like to start a thread about it should. This will keep the newsgroup rounded out. It will also allow people to compare opinions and radios or other equipment to each other.

1990. VHF Amp

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-02 00:00:00 UTC
From: twilson@ag-eco.tamu.edu
Message-ID: <4trns6$dnp@news.tamu.edu>
Source record: 196737

I have a basic question about amps for 2 meter VHF. I just bought a Kenwood 751A 2 meter all band. According to the manual, it transmits in 5 watts in the low mode, and 25 in the high power mode. Now, if I decide to add an amp, what should I look for in input/output power? Does that mean I need one that takes a 5 or 25 watt input only, or will it work with an amp that takes something else? In other words, would one stating 10 watts input/200 output, say, work ok with 5 watts input, realizing I wouldn't be getting the 200 watt output? Or does the amp have to match the exact output of the radio?

As you can see, what I know about amps fills a very small thimble.

I like this radio for a number of reasons - this is one of the biggest. To me, alpha memory names which replace the frequency display are not useful. With the FT-51R, you get both alpha labels and the frequency. If I could only keep one HT, this would be it.

As for the loose BNC, I don't doubt it occurred. I think any HT with a BNC connector has to be treated with care because of the nature of BNC's. Gary Coffman has made several informative posts outlining the life expectancy of BNC's as they are not designed for a high number of mating cycles (I think he said 200 or so.)

Hi Dave
I repainted a ts-440 for a friend of mine and looked all over for paint that would come as close as possible. I looked in on auto paint and found that PLASTI-KOTE car color (GM 7181) come as close as I could find.
I removed all covers on radio and sanded them down to bare metal, put two coats of gray primer and then put 4 coats of the other.
SO good luck
Dave

No response from anyone on .swap, so, I have an older 800 MHz mobile telephone transceiver (floor mount) with no control head (handset). Made by Matsushita (Panasonic). You can have it for just the cost of postage (maybe $10 to $15).

Source record: 196743

Hi,

I've got a Yaesu FT747GX HF transceiver with
an intermittent/erratic problem. Periodically, while
transmitting, the RF meter pegs at maximum but the output
of the transmitter on a RF wattmeter drops to near zero.
It seems like the transmitter is putting out wideband garbage.
I removed the excitation/drive from the final RF amp assembly
and the symptoms continued. It seems like the RF amp is
taking off due to a parasitic oscillation.

Symptoms first showed up on the 20 meter band but by
moving several bypass and coupling caps near the toroidal
output transformer, the symptoms now more often appear
on the 30 meter band. I may have changed the parasitic's
frequency or changed stray coupling.The related mica capacitors
seem ok when tested but that doesn't mean that they are not
breaking down during high RF voltages. Outside of shotgunning
it and simply replacing most components in the final RF asembly
(time consuming and costly), does anyone have any ideas??

Thanks,
Doug

Sounds like a good solve, to a problem that happens to anything with a
plastic window.

Also, try Bills idea with placing a clear tape over the lens. I've
done this and it works great!

With the keypad off and the battery, knobs and antenna off, push lightly
on the circuit board under the 'keypad' (where the keypad was).
What you are going to do is push the entire radio out the back of
the black plastic case. There is a red rubber gasket that seals
the radio and the black case. After removing the keypad, knobs and
antenna, all that is holding the radio in, is the red rubber gasket.
The radio should come out bottom first, and then the 'stuff' on top.
Hope this makes sense. It's actually pretty easy to take apart, it's
just a slight departure from 'norm' in the way that the radio is assembled.
Lemme know (and the newsgroup what you think of the innards of the 50)
I think it's neat.
One thing that you may think about checking or actually doing since you
have the radio apart is to put a dab of heatsink compound under each of
the power amp bricks. My '50 didn't have any. (I wonder if that is why
the UHF brick is bad????) Anyway, rather than wait for the new brick
and have a disassembled radio, I dabbed the VHF brick and put the radio
back together so I could operate the radio (cuz it's neat, ya know!)

The PTT, Moni, Lamp buttons should be all one piece, installed together.
When putting the radio back in the case, pull out the MIC/Ear phone connector
cover. Also the BUSY/TX LED thingey can be slid up in the case and after
the radio is in, it can be slid back down to position.

This is my own translation of the "9600 Baud FSK-Modifikation fuer
das Kenwood TH-79e" document posted to rec.radio.amateur.equipment. I
make absolutely no warranty about the accuracy of this translation or
its suitability to any particular task, especially that of opening up
your expensive radio and attempting to solder things. Due to this
document's nature, as a translation, I can make no claim about the
suitability of the information I've translated to any particular
task. Good luck, but don't blame me if anything doesn't work.
My comments on the text and its translation are in [square brackets].
See also my notes below, and the included original (German) version.

```
*****************************************************
* 9600 Baud FSK-Modification for the Kenwood TH-79e *
*****************************************************
```

Good day all!

This is a guide to the alteration of the TH79e for 9600 [baud packet].

1. The Opening of the Radio

Remove all plugs and cables from the radio, and remove the battery. On
the back of the radio, remove the three screws; also remove the screw on
the side of the radio, by the antenna connector. Carefully open the
case. Set the case halves down with the LCD-display half to the left,
and the other side to the right (who would have thought? :-). If
there's a CTCSS module inside, that comes out as well :-)

2. RX-modification

Carefully unscrew and remove the four screws in (what I call) the
"power"-half (with the pair of HF-hybrids [I'm not familiar enough with
radio terminology to know if this is translated correctly or not. -ian]
and the many sheets of copper) of the case. In order to do this, you
must also desolder the BNC connector for the antenna. On the underside
[no mention of what; presumably the circuit board -ian] is a Motorola
MC3372D (Demodulator) IC, used for UHF. The RX-cable should be soldered
to pin 9 of this chip. With this, the RX-output from the UHF receiver
IC is finished.

2. TX-Modification

In the second half of the case (with the potentiometers and the
MIC/loudspeaker connector) is a "daughterboard," on which the microphone
amp is housed. Simply turn the board over [lit. "put the board under"],
and put a wire on the resistor next to the IC 308 (TA75W558F) and
that is the TX-input ["input" may not be technically correct (my

dictionary fails me on this word, "Einspeissung") but it is thematically correct, and makes sense given the context -ian].

I hope that this little drawing will make things a bit clearer :-)

The wire should be soldered to the upper contact of R (where the R is in the drawing); the correct resistor is bigger than the others.

```
+------------------------------+
! R + !
! ## + ***(IC308) !
! ## *** !
! ## !
! ## !
! ## !
+------------------------------+
Plug to the
big circuit board
```

When you're finished, plug the daughterboard back into the contacts.

4. Final Word

So, the 2 wires are soldered, and there's nothing standing in your way? [i'm possibly being a bit free with that last phrase. literally, it's "there are also no un-wished-for bridges standing" -ian] OK, then follow the directions from point 1 in reverse order to put the radio back together, do a short function-test, and then the whole thing can be connected to your FSK-modem.

Thought must still be given to how to connect your wires to the outside world. Either a small circuit board-mountable connector (with three poles, and one pole filed off) or a 2.5 mm mono [headphone-style] connector (which will most likely only fit if filed down in any case) need to be built into the radio.

I accept no responsibility for the correctness of information given in this guide, or for any damage to your radio which results from your modifications based on this text. The guide has gotten a bit bigger, but therefore (I hope) simpler and also more understandable for non-professionals (a bit of soldering experience is needed, of course).

[no author credit given.]

Translated by Ian Johnston, KC7RYN, in the hopes that someone will find it useful, and was unable to read the German version. I accept absolutely no responsibility for the correct translation of this text; this is my best guess, and it's probably right, but don't blame me if your radio fries after trying this. I have never seen a TH-79e, so my descriptions are based entirely on the German version.
I've included the German version, as posted by
ea4abb@linux.ea4abb.ampr.ORG (Roberto Munoz), on July 29th, to

rec.radio.amateur.equipment. I hope that someone else who can speak
German will proofread my translation, and make corrections as necessary.

Hello ! Here I send you the TH79 mods to connect to a packet 9600 bps modem=
.
The problem for me is that the text is in another language.

I hope someone can translate it to English or Spanish=20

----ZZZZZZ>>>>

**=20
* 9600 Baud FSK-Modifikation f=81r das Kenwood TH-79e *
**=20

Tach zusammen !

Hier kommt ne Anleitung zum Umbau des TH-79e auf 9k6.

1. Oeffnen des Ger=84tes:

Alle Stecker incl. Antennenkabel abziehen, den Akku entfernen.
Auf der Rueckseite des Geraetes die 3 Schrauben loesen, ebenso wie=20
die kleine Schraube an der Seite beim Antennenanschluss. Vorsichtig=20
das Gehaeuse oeffnen. Nun die Haelfte mit der LCD-Anzeige nach links=20
legen, und die andere nach rechts (wer haette das gedacht :-)
Falls ein CTCSS-Modul drinne ist, kommt das auch raus :-)

2. RX-Modifikation:

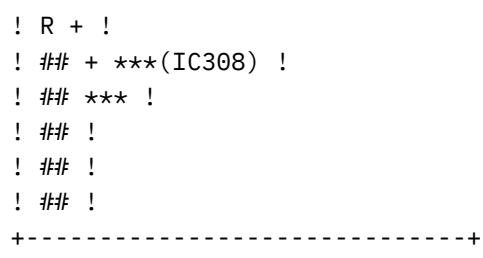
Die vier Schrauben in der (ich nenn sie mal) "Power"-Haelfte (mit
den beiden HF-Hybrids und dem vielen Kupferblech) rausschrauben und
vorsichtig rausnehmen. Dazu muss noch die BNC-Buchse weggeloetet werden.
Auf der Unterseite gibts nen IC Marke Motorola MC3372D (Demodulator),
der ist fuer UHF. Das RX-Kabel wird da am Pin 9 angeloetet.
Damit ist der RX-Ausgang vom UHF-Empf=84nger IC schon mal fertig :-)

3. TX-Modifikation:

Im zweiten Gehaeusedeckel (mit den Potis und den MIC/Lautsprecher-Buchsen)
gibt es eine "Tochterplatine", die den Mikrophon-Amp beherbergt.
Einfach die Platine runtermachen, ein Draht an den Widerstand neben dem
IC 308 (TA75W558F) und das ist die TX-Einspeisung.

Ich hoffe, in der kleinen Zeichnung kann man was erkennen :-) =20

Der Draht wird am oberen Kontakt vom R angeloetet (wo das R steht), der=20
betreffende Widerstand ist ein groesserer Widerstand als es die andren=20
sind.=20



Steckkontakt zur=20
grossen Platine

Wenn fertig, wieder die Platine auf den Kontakt stecken.

4. Letzte Schritte:

So, die typischen 2 Draehte sind angeloetet, ist auch keine Bruecke
unerwuenscht entstanden ?! OK, dann das ganze Geraet in umgekehrter Reihen-
folge wie beim Zerlegen unter Punkt 1 wieder zusammenbauen, kurzer
Funktionstest, und dann kann das ganze schon an das FSK-Modem angeschlossen
werden.=20

Gedanken muss man sich nur noch =81ber die Verbindung zur Aussenwelt machen=
,
entweder einen kleinen Platinensteckverbinder (3-polig und einen Pol davon
abfeilen) oder eine 2,5mm Monobuchse (passt wahrscheinlich ebenso nur ab-
gefeilt rein) ins Geraet reinbauen.

Ich uebernehme keine Verantwortung f=81r die Richtigkeit der in der Anleitu=
ng
gemachten Angaben und f=81r Schaeden die im und am Geraet durch die Modifik=
ation
entstehen. Die Anleitung ist etwas groesser geworden, daf=81r aber (hoffe i=
ch)
einfacher und auch f=81r Nicht-Profis (etwas Loeterfahrung braucht man scho=
n!!)
verst=84ndlich.

Hi,

If you mean you are looking to replace an antenna and receiver to listen to the ham bands there are probably legal restrictions blocking the way. While it may not always be illegal, it usually would be illegal and most of us won't be connecting our radios directly to the net.

Hi All,

Name is Adam, located here in Ashland, MA. I have for sale a Henry Radio Tempo One hf rig. It covers 80-10 Meters, CW/SSB. Also have matching power supply and external speaker. Great spare rig or first HF. I don't have the space in my shack or for antennas! Asking $250/bo or trade for 2m or 440 or dual band radios. Any offers/trades welcome.

Thanks and 73,

Adam/KE1BG

The most "MAJOR" complaint seems to be from folks who want this unit to
listen to FM broadcasts. (Stupid me I thought the unit was primarily for
amateur freq's...ever hear of a WALKMAN???)
The DVR function of the FTT-12 keypad is screwed.
Otherwise it is a very tight and neat little HT. I find it gets alot
more use than any of my Motorola HT's.
Works great. Hears great. Freq coverage is perfect for my needs.
But then to each his own.

Later..Chip

2024. HTX-404 ER2 help please

From: K5ESW@nando.net
Message-ID: <4tvi5q$rei@castle.nando.net>
Source record: 196572

I have a Command Technologies HF-1250 amp for sale. Uses a single 3CX800A7 for 1250 watts SSB, 1000 watts CW, and 750 watts RTTY. Reguires 50 - 60 watts drive. Operates 160 - 10 meters. Does not include QSK option.

Amp is in excellent condition. I bought it from orginal owner three years ago. I recently decided I want QSK, so I bought another amp.

The Commander HF-1250 is a very well built rugged amp. See their ads in QST such as July 96 issue (page 167.) New cost is $1895. These amps are only sold direct from the factory.

Selling for $1100. Includes boxes and manual. Prefer local pickup or meet you half way.

uh, why would LISTENING to a radio be illegal? it might be an interesting
idea to set up banks of remotely controlled receivers that could be listened to
with one of the "real time audio" formats...

(<sheesh> <grumble> extra class ham telling people that it's illegal to listen
to amateur radio when we don't have an "privacy" protection - specifically
stated in the various rules and regs...if anything we could use more people
discovering amateur radio and what it is today instead of those 1950's/1960's
Q&A manuals that are stuck on the average library shelf for those few who are
interested enough to look something up on the subject..)

Wow! This had never occurred to me! I have an old AOR 2500 widerange monitor sitting here with a cute little DB-9 connector on the back and a manual full of commands that can be sent to tune and configure it. It seems it would be pretty straightforward to build some CGI to send tuning commands and hook the audio out to a RealAudio server.

Using this config, anyone with a web browser could grab my scanner and listen to what's in the air in Phoenix. Now the question is "Who cares?" Plus, I'd have to set up a web server on my Mac, leave it running and on the net all day. Sounds like a project for someone with an existing server.

Interesting idea though.

>>It's ADI AT-200 2m transciever...

I have first-hand knowledge regarding its sister product, the 440MHz HT AT-400.

I don't like the "feel" or construction of the ADI units. Please look into the country's most popular 2M HT, the Radio Shack HTX-202, if you need a unit at or below $200.00. Or join your local Amateur Radio club and see who's possibly selling something of interest!

2039. HF Receivers For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-03 00:00:00 UTC
From: tony@bright.net
Message-ID: <4u08qr$9uu@cletus.bright.net>
Source record: 196586

For Sale:

1. Panasonic RF-4800 receiver, in excellent cosmetic and operating condition. This receiver covers LW/MW/FM/SW 1.6-30 MHz, with a switchable digital display and BFO. It also has two IF bandwidths, multi-speed tuning, and separate antenna inputs for each band. The RF-4800 is a tabletop set, but can be operated from 8 "D" cells or an external 12 Volt supply. The set has terrific audio. I will sell the RF-4800 for $200.00 OBO plus shipping.

2. Sony ICF-7600G SW portable, in near-mint condition. The radio is approximately 8 months old, and comes complete with the original box, manuals, and reel-type antenna. I'm selling this set because I'm using my Grundig YB-400 much more often, and I don't need both. $125.00 OBO plus shipping.

Please reply to tony@bright.net, or call (419) 538-6479. Thanks!

2040. CMOS Super Keyer 3

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-03 00:00:00 UTC
From: Connie Hulst <chulst@polar.polarcomm.com>
Message-ID: <3203B508.2DA2@polar.polarcomm.com>
Source record: 196587

I just built a CMOS Super Keyer 3 (August 1995 QST) and I really like it. However, I had one little problem with it...

After using it a couple of days, I plugged it in one day and found that the speed and tone were twice as high as usual! The voltage coming out of the 7805 regulator was normal, and current draw was also normal. I suspected a weak ceramic resonator was the problem, and I ordered a couple more resonators from Digi-Key. In inquiry mode, the keyer still said it was going 25 wpm (not true). However, when asked for its tone, it responded "255"! You can't set the last digit to anything but zero! I sent "T90" in function mode, and the tone and speed came back to normal. It has worked ever since...!?!?

If anyone has any experience to share concerning this keyer, please e-mail me.

2042. Re: anyone know where to find output "2sc1307"

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-03 00:00:00 UTC
From: lwhiting@stic.net
Message-ID: <3203beb6.6505042@news.alt.net>
Source record: 196589

N.E.C. stopped making the 2SC1307 about 15 years ago. There hasn't really been any good replacement for it until recently. Most people will tell you to use the 2SC1969 which is not as tough and has less output or use the 2SC2312 which is more rugged than the 2SC1969 but has even less output. You might also try the 2SC2098, in certain applications it works quite well. But the best replacement that I have found is the MS1307/MPS1307. Not many people now about this transistor but it is a very good replacement for the 2SC1307. RF Parts has them in stock @ $5.95 each. Alternatively, if you can find an old 858 SSB chassis (lots of the early 40 ch. SSB CB's), they used the 2SC1306/2SC1307 combination. Good Luck

Philips ECG supposedly has a universal replacement for 2SC1307,
2SC1307-1 and 2SC1307K. Their ID is ECG236. These can be found at
some parts houses catering to the service industry.

Yes, there is a keyboard mod to push RF output to 7 watts.

Save your money. The SW8 is sufficiently sensitive and (front-end)
selective already. A pre-amp will probably degrade performance and a
pre-selector would be redundant.

Hi Clark,

Reminds me of when a friend of mine needed to dump some old house bricks. The local tip was closed so he decided to dump them illegally near a building site. He had just unloaded them, when a cop pulled up and asked him what he was doing, so he said, "I was just going to take a few of these old bricks." The cop told him to leave them there and p**s off home before he booked him!

You just need the right attitude!

(How about that dead cat story)

Best regards,

The single best reference is probably _The Gates Battery Handbook_.
Powersonic and Sanyo also have good books out on the selection, care,
and use of various sorts of batteries.

>Can anyone with first-hand experience suggest the following:
>
>1. If one had 2 batteries, would you use one till it ran out
> and then switched to the other battery, or, run both in
> parallel? I assume parallel would be best ...but....

There are several factors to consider here. The primary one,
I think, is that battery discharge amp-hr capacity is larger
at low discharge than at heavier discharge. Thus running the
batteries in parallel will give you more operating time than
using them serially. That's because each only supplies half
the ampere-hour discharge rate in parallel duty that they
would have to supply in serial usage. (You need to look at
the discharge curves to fully appreciate this. It may give
you as much as 20% more operating time if you can half the
draw on the individual batteries.)

Operating considerations, IE you might want to charge one
battery while using the other, or you might want an emergency
reseve battery in case you draw the first one down too much,
may dictate that serial operation of the batteries would be
a better course in a particular situation.

>2. Do gel-cells require constant voltage or constant current
> to properly recharge? I believe NiCads prefer constant
> current.

Ordinary wet cells want a constant voltage charger. Gell,
or depeleted electrolyte as they're called today, cells
have a slightly more complex charging requirement if you
want best performance. They need a combination charger
which both limits current and voltage at various points
in the charge cycle (constant current, limited to prevent

gassing, early in the charge cycle, constant voltage at a
tapering current later in the charge cycle, and a small
maintenance constant current trickle at full charge). There
are single chip charge controllers which can accomodate this.
If you don't mind slow charging, then an ordinary constant
voltage trickle charger will serve adequately.

>etc? does it have enough features to be a good base station rig?
>Is Icom a quality HF manufacturer who stands by its stuff? Are
>there any compromises for it being able to operate in HF 50Megs,
>and 2m?

Lets take the last question first. No, there are no significant compromises due to adding 6m and 2m to the radio. However, there *are* compromises due to packing all the many features offered by this radio into such a small package, and selling it for such a low price. So, to the extent that 6m and 2m are added features which take up room, they do have a minor effect.

Icom is certainly a quality manufacturer of amateur gear. They are one of the Big Three in the business. (That doesn't mean they haven't turned out their share of lemons over the years, of course, but they're certainly no worse than their competitors in that regard.) The IC-706 is *not* a lemon, but neither is it targeted at the high end, performance at any cost, HF radio market.

Its niche is the amateur who wants a lot of features in the most compact form possible while not having to spend the price of a compact car to get it. Thus there are some compromises in radio performance with the IC-706 versus some of the larger top of the line models.

Some of the compromises are; the radio will overload on strong signals if you don't manually use the preamp/attenuator switch properly. That's mostly a problem for home stations, in mobile use the antenna usually is inefficient enough that overload isn't a big problem. The radio has a small amount of filter blowby due to the IF filtering scheme chosen. IMHO, this isn't a serious problem for most amateur operations, but might annoy the ultimate Dxer. There is no built in antenna tuner (no room). Many functions are controlled by a menu system which I consider inspired, but which

some others do not like. The 2m FM repeater functions are not as simple to use as those on most VHF only radios, though you can do everything you need to do, it just takes a little more manipulation. Completely offsetting that in my mind is the fact that you have SSB, FSK, and CW on 2m, which most 2m rigs don't have.

I don't consider any of those factors defects, just necessary compromises. However, the radio does have a few genuine defects. For the CW operator, QSK keying clips dits (a firmware problem). For the voice operator whose voice naturally lacks punch, the supplied microphone isn't great (it's easy enough to use a different microphone). The advertised wide coverage VHF reception of the radio doesn't work right unless you modify the radio (mods are widely published). And the IF filtering for the WBFM section is abominable. There are workarounds for all of these problems except the last one. A new filter is needed to solve it, and Icom hasn't offered one yet. Of course if you don't want to listen to FM broadcast with this radio, it won't matter to you (it isn't stereo anyway).

I think it is a great radio (and according to the sales figures so do a lot of other people). It isn't a perfect radio, but it offers more useful features in its form factor and price class than anything else on the market. For home use, it has some features I wish my IC-735 had (but I wish it had the IC-735's resistance to overload). For mobile use in today's cramped cars, however, it has no peer as a small all in one solution. I haven't said much about its strong points, and it has many, but you can get those from the advertising copy.

If you don't care about VHF coverage, but size and price are still a concern, then look at the Alinco DX70T. It's a good HF radio too, and small. If you don't care about 6m either, and have the room to mount it (and the extra money to buy it), then the Yaesu FT900 brings the most to the table for HF mobiling. The only small radio I'd ignore is the Kenwood TS-50. It doesn't offer anything the others don't do better.

If you've got plenty of room (say a RV) to mount the rig for mobile operation, and if you want the best home station performance, and if money isn't a concern, then you want the Yaesu FT1000, or the Icom IC-775, or the Kenwood TS-870 (probably in that order, though they're all good). That's a different class altogether, and not the target market of rigs like the IC-706.

>A Guy named Moe wrote:
>> I am wondering what is the main factor in deturmaning the distance that
>> a signal my be sent quickly and with clear reception?
>
>The *main* factor is the receiver.

Beyond line of sight, the main factor is *propagation*. Antennas can be important, and the receiver certainly is (but Marconi used a glass tube full of iron filings to span the Atlantic). The modulation used makes a difference, and transmitter power is the catchall factor. The frequency chosen is also an important factor since it influences all the other factors. The whole thing has to work as a system.

Signalling speed (baud) for terrestrial beyond line of sight paths is determined primarily by multipath. Operating near the MUF (for ionospheric paths) will reduce multipath, and coherent M-ary modulation with proper coding can resist it. At VHF+, antenna directionality and siting are the largest factors in controlling multipath. Good modulation choices (such as SS) can resist its degradations.

For free space paths, SNR (and available bandwidth) dominate as the factors controlling signalling speed. Coherent modulations again help in resisting degradation by low SNR (incoherent OOK is a poor choice, incoherent analog modulations a worse one). A stronger transmitted signal directly affects channel SNR. A good receiver can avoid excessively degrading channel SNR (both through using low noise devices to avoid contributing to channel noise and by using matched filtering to avoid passing out of channel noise), but it can't improve channel SNR. A directional antenna can effectively improve channel SNR over isotropic by restricting the noise coming from other directions on channel from reaching the receiver.

Assuming adequate techniques are used for each link in the chain, for a given frequency, the order of importance probably goes like this;

1) Propagation
2) Antennas
3) Modulation
4) Receiver
5) Transmitter

Propagation dominates, and is the largest loss factor and the
largest factor contributing to multipath. Antennas couple to the
propagation path and thus are key elements. The modulation chosen
determines how well the signal can resist the various impairments
caused by propagation. The receiver must avoid degrading channel
SNR as much as possible. And finally, enough transmitter power
must be used to overcome all the loss mechanisms. The amount of
transmitter power *necessary* is often surprisingly small, however.
With the correct choices of other factors, a few milliwatts can
easily span the globe.

From: gary@ke4zv.atl.ga.us
Message-ID: <1996Aug3.120538.5154@ke4zv.atl.ga.us>
Source record: 196610

In article <31FDEB75.4E@cqg.com> Norm <norm@cqg.com> writes:
>My monitor causes considerable QRN with my TS-440 on 20 meters. Is there
>any way to eliminate this interference? email norm@cqg.com

Yes. You can shield the monitor. GC has a conductive EMI spray which
can be used on the plastic case, or you can line the case with one
of the adhesive backed metal foil products (copper foil is best).
All cables entering and leaving the monitor need to be adequately
suppressed to the shield. In HV areas of the monitor, fish paper
should be used as insulation for the shielding to prevent flashovers.
And don't cover the ventilation holes, perforate your added shielding
in these areas.

The DAG coat of the CRT should be connected to the shield. The CRT
forms a good RF shield if it is of the shadow masked type (color),
so you don't need to shield the face of the CRT. If it is a mono CRT
though, you'll need to use black wire mesh to shield the face to
prevent radiation from leaking out of the monitor through the CRT.
This can double as a glare shield.

Tighten up the shielding of your transceiver too. It should receive
no signal with the antenna disconnected. Use good 100% shield coax
to the antenna, and make sure the antenna is as far as possible
from the monitor. Cable routing matters too. *Don't* neatly bundle
cables. RF can be induced from one to the other by transformer
action. Try to route the cables well apart, and at right angles
to each other as much as possible. Use ferrite snap on chokes
liberally.

"Grounding" is a trickier issue. A connection to Earth doesn't
magically eliminate RFI. In fact, it can sometimes make it worse
by creating ground loops. You'll want to experiment here to determine
if isolated power or a single common point *inside* the station
will help reduce RFI (it may vary from one band to another which
method works better).

>thats right, you said you were a NEW guy. When you say ham 'equipment', you're
>probably referring to a Radio Shack HT, right ?

Not so fast. Back when you paid $1400 for a top of the line radio, a new car cost $5,000. Today they cost over $20,000. Back when I bought the top of the line in 1964, a B&W6100 cost $895, but a new full size Chevy cost $2100. A 1964 dollar is equivalent to 9 1995 dollarettes, so that old B&W is equivalent to a $8055 dollar radio today. The dollarette isn't what it used to be, but compared to the price of other goods, amateur equipment is cheaper today than ever before. In 1964, the average teenager working a summer job would have needed over 6 months to earn the money for a B&W6100 (and that's just a transmitter). In 1995, a teenager would only need to work for about 2 months to earn enough for a IC-706, and that's a heck of a lot more radio.

And while the old B&W has been reliable, I've had to replace tubes, paper electrolytic capactitors, pots, switches, etc to keep it going. Today's all solid state rigs don't need periodic tube replacement, use improved tantalum or aluminum electrolytic capacitors that don't dry out, and optical shaft encoders. My IC-735 is now 9 years old, and the only thing I've ever had to do to it is resolder a cold solder joint in one of the bandpass filters. And that was when it was nearly new.

Reliability is way up, costs (in constant dollars) are way down, and the functions available on some of the newer radios weren't even dreamed of 20 years ago. The technology didn't exist to do some of the things we take for granted on the newer radios and associated equipment. In 1964, operating a digital mode meant a lumbering noisy Model 15 with a 60 mA loop supply (ouch!). And a huge rack mounted receiver and transmitter which, if not crystal controlled, required constant attention to keep tuned. Today, it's a tiny low power box of solid state electronics that's completely silent, doesn't spew chad all over the shack, and does a better job of printing weak stations using PACTOR or Clover than the old

Mod 15 and TU could ever hope to do. And when we set the radio on a frequency and adjust the variable filters for a nearly perfect matched filter condition, we can walk away and fully expect it will still be on channel and operating when we come back.

When you compare old equipment to new equipment, you're comparing a stone axe with a loose rawhide binding to a fiberglass handled tungsen nitride treated super alloy axe that's as at home cutting through sheetmetal and plexiglass as it is cutting through pine, and which costs fewer manhours to possess to boot. When equipped with a few accessories, it becomes a nitro burning supercharged chainsaw, but it doesn't require the output of Niagara Falls to power it, or RFK stadium to house it. Progress, it's a wonderful thing.

>radio won't work and I don't want to send it off to radio shack for
>repair.

ERR2 is indeed the PLL unlock code. This usually occurs when attempting
to run the radio off of 12 volts while using the rubber duck antenna.
At that high output power, RF feedback can cause the PLL to unlock. The
solution is, don't do that. Use the standard voltage battery when using
the duck, or use an external antenna if you run off of 12 volts.

Simply turning the radio off and back on will usually reset this
condition. In some cases, a full radio reset is required (note,
you'll lose anything stored in memories if you do this). If the
problem persists when you run standard power, or occurs at all
times, then you may have a hardware problem. If you want to attempt
to align the PLL, *get the service manual* and follow the steps
in it. If it won't align using that procedure, it is broken and
you'll have to do component level troubleshooting.

From: Joe Fikes <jfikes@ro.com>
Message-ID: <4u00ll$u0g@news.ro.com>
Source record: 196614

Does anyone know where to find a really good source for mods and other information on the venerable IC-751A? I've found several FTP sites with a few little things, but they're pretty sparse. Is any info available on when the different serial numbers were manufactured. What about messing with the battery-backed memory? I understand some people have gotten it to work on 6 meters. Any other strange or exotic ideas?

FWIW... I just bought the radio as part of my wife's uncle's estate (W1KGH-SK). I've been in ham radio for a long time, but have not spent much money on it to date. It's a fabulous radio compared to my old, trusty, Drake TR-3, but it doesn't have the cheerful glow coming through the screening!!

The USA template (actually an rdf file) is built into the program. It is the defualt data file. To toggle your radio back to USA mode follow these steps:

1. Do RADIO|GET DATA FROM to create a rdf file to use as a template.
2. Do FILE|SAVE AS and name the file USA.RDF.
3. Do FILE|NEW. (The top of the screen now displays FT-50 Programmer - Noname.rdf.)
4. Do RADIO|SEND DATA TO.
5. Check the USE TEMPLATE box.
6. BROWSE TEMPLATE and select USA.RDF
7. Follow the step on that screen to put the FT-50 in clone mode.
8. Click OK.

After the download to the radio it will be in USA mode. If you have any more problems give me a call at 1-205-880-3093.

Geez, now the appliance operators are complaining about having to push
a few buttons to get their radio working.

Maybe RS did that on purpose just to insure you'd read the manual.

The repeater in question is the 145.15 repeater in Starke, FL. The
input freq. is 144.55. The pre-mod minimum xmit freq. is 144.60. I
had to do the extended receive mod to use the repeater although I have
to do the offset manually.

A pang of nostalgia makes me want the Novice rig of my youth.

If you have a Hallicrafters S-85 receiver (any condition) or
a Globe Scout 640 transmitter (any condition), let me know.

I'm not looking for pristine 'museum' pieces, just about any condition
would do. Working condition is a bonus, of course.

This was my first serious Novice station in 1975. I found both units at
a garage sale for $45 for the pair (!) in excellent condition. The man
selling them was so impressed by my interest, that he through in a key, a
big spool of copper antenna wire, a box of crystals (remember those?)
and a bunch of other little goodies to start a station.

As I recall, that night I had it all up and running and worked about 15 states
before I conked out. My actual first rig had been a Heathkit HW-7 QRP rig and
I had dismal sucess (didn't know how to listen yet!). When I got the S85 and
Globe Scout on the air, you'd have thought I had a killowatt on a mountain
top!

At that time (I was 13), I raised money by working in yards, and had just that
day cleaned 3 roofs at $10 apiece and had another $10 saved, so I was $5 short
for the rig. The man said he'd hold the gear for me while I went and earned
another five bucks. I ran back to the last roof job and convinced the owner
that I could do an even better job for another $5, and up I went! I somehow
managed to find some more moss and leaves and earned my money. Within 2 hours
I was back with the full $45.

Anyway, don't mean to bore anyone. You know how nostalgia for this stuff
works.

Source record: 196422

Greetings...

Well, it didn't take long for me to screw up my FT50... the first attempt to get a template file out of hit failed halfway through and left the radio in Euro mode. I know how to fix that if I had a good USA template file, but I don't.

Does someone have a copy of the USA template file they could post or email (UUencoded, of course) to me?

To Bill Childers -- this would make a nice addition to your FT50 web page... :-)

(It probably doesn't matter when using a template to reset to USA mode, but my FT50 does *NOT* have the MARS/CAP mod.)

Thanks much!

2089. Extend UHF Rx on Icom W21AT?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-04 00:00:00 UTC
From: jonbloom@aol.com
Message-ID: <4u1b9s$k92@newsbf02.news.aol.com>
Source record: 196429

I recently purchased a secondhand ICOM W21AT, and I'm wondering how to modify the UHF recieve to include up through 454.000 Mhz. I'm a reporter, and I would like to be able to monitor the local P.D. frequencies without having to carry a separate scanner. It would also be nice to take advantage of tone squelch, to eliminate the sprays of data transmission that often blast from the scanner between communications.

Interestingly, it appears that a previous owner of the radio did something to allow TX across the entire VHF range, rather than just the amateur 2-meter band. Though it would not currently be legal for me to use this capability, it may come in handy down the road (for example, to communicate with the photographers in their cars on the business band, if I decide to get licensed for that), and so if it's a software-type modification, I'd like to make sure I don't lose it as I perform the UHF receive modification.

Anyone have suggestions for this? Thanks.

Hi Ben,

I have had good luck getting replacement manuals directly from Radio Shack in the past. I don't think I ever paid more than a few dollars for any of them. If I remember correctly, all they need is the R.S. catalog number, which is usually on the rear panel of the unit somewhere.

Just an idea!
Good luck

2091. Adjusting Deviation on FT-50R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-04 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-0308962223220001@192.0.2.1>
Source record: 196431

I was trying to adjust the deviation on my FT-50R and noticed the VHF and UHF pots are not independent. I first tried to increase the deviation on UHF (which I use 95% of the time), and lost all TX audio on VHF. I was finally able to adjust both pots to get decent audio on UHF and VHF, but the TX audio is still a little low. Also, turning the pots the slightest amount has a significant affect on the TX audio (I lost VHF TX audio when adjusting UHF deviation just a *LITTLE* bit).

Has anyone discovered the best way to adjust the deviation? Anyone with a service manual have the "correct" procedure?

Otherwise, the FT-50R is a *GREAT* little radio. Mine has all of the mods.

Hi,

Well as far as my radio goes there is no birdie at 146.000 or anywhere in the 146+/- area.

The radio does not receive broadcast radio that well....(who cares) I have a regular radio for that.

As far as other 'scanning' regions...BUY A SCANNER !!!

I like the ft-50....but to hell with this dumb scanning stuff...that's why they make scanners. They should put more of there time into making a better, narrower receive front end.

Want to make a radio to cover 136-174 and 420-470 great but the rest is hogwash....you bought a 2way transceiver not a scanner and no one will make one that is as good as the 4sra or 2sra. Only because they are two seperate receivers int he same radio. A dedicated scanner and a 2way txmitter.

IMHO

2106. HELP! FT2400H stopped TX

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-04 00:00:00 UTC
From: kb2rmi@pop3.frontiernet.com
Message-ID: <4u25tk$1ija@cheatum.frontiernet.net>
Source record: 196446

I have the Yaesu 2400H. This morning, I used the rig, then shut it down. About an hour later I powered it back up and it would not indicate any transmit on any power level, everything else seems normal. As I bought this used w/o a manual I am wondering if this rig doesn't have some sort of a lockup function or problem that I may have inadvertently initiated. When I turned it on for the second time I was going to use the autopatch, and hit the * key, not sure if it was transmitting then., but didn't hear the repeater tone. Any suggestions on what this might be would be appreciated, also email replies would be greatly appreciated.

Bob:

Yaesu claims it can not be done. A wider filter would be too large to
fit in the allowed space, so no fix available, or planned in the future.

I have made it to work on two units. The is a small
trimmer cap under the metal shield on the IF unit. I
forget how it's labeled but it's something like FWD
or FW. I did notice on both units, while using a
spectrum analyzer, that if the power is increased
past ~130W a big spur (a couple of watts) appears a
couple huncred KC away while operating on 20 meters.
The monitor audio also begins to sound scratchy. I
left both radios on 125 W.

Hope this helps
Pieter

Right but here is the point: You don't have a license (yet - I know you are working on it - good luck!).

How do I know? By your own words:

".....I said why don't they take that to am where that kind of behavior was expected....then we had to go to 38 lsb. They branched off again! They tied up 3 lsb channels on skip, and had no consideration for those with children in the radio room.
This speeds up considerably my rate of speed to ham-dom"

(posted by you on or about 7/28/96)

I'm not flaming you Hacker. I have read your posts and I believe you will make a fine addition to amateur radio...

I just wanted to point out the fact that you are both right in a way.

Try this:
If you go to pin 10 of the MB8719 PLL chip this pin should be not connected. If you ground this pin, the PLL will lock 640 KHz above every CB channel. This 640 is not enough because 27405 +640 = 28045. Now if you solder a variable resistor to this pin to ground and then vary the resistance slowly. There will be a point where the PLL locks +1280 from every CB channel. I recomend using 1K or 2 K ohm pots from pin 10 to ground. Now place the radio on a low channel and try moving the pot until the PLL locks +1280. You can then put a switch to select either grounding the pin (+640) or resistor to ground (+1280). All the pins next to pin 10 are PLL programing in binary descending order (1280 and 640), 320,160,80,40,20,10 KHz. In order to make the PLL lock on all the way to the upper frequency limit (1280+27405=28685 on CH 40) you have to tweek the red shielded coil that is next to the PLL and has wax on it. This if the VCO coil. After you tweek the coil, you can reheat the wax with the soldering iron and it will re-melt and look good. Also after tweeking this coil, the radio will not lock on the CB band. Now all that is left is tweeking all the receive filter and transmit filter inductors and the radio will work fine.

Cross-posted to: in.ham-radio,ott.events,ott.general,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

It might be illegal to connect the licensed station to the net. It might not, too. I did not say "listening to a radio" is illegal! How does the FCC regard this media? Are we retransmitting amateur signals (for moentary gain)? Is anybody (including the service provider) receiving any money for the relay or rebroadcast of these signals?

PLEASE don't ask the FCC!! It sounds like a lot of people are getting a lot of harmless enjoyment from this. If you are involved in the actual connection for the relay or rebroadcast... keep an eye over your shoulder.

I think I beat you to it. At this point, you have three choices. One, reset the CPU to "U.S." mode. You will be able to use the ham freqs and little else (rx or tx). Two, stay in European mode and not be able to tx above 146mhz in 2 meter (we never looked at 70cm). There is no way for the end user to get the FT-50 back to the state in which it came out of the box. This was confirmed Yaesu USA tech support. Frequency selection is hosed. ARS is hosed. Etc. is hosed. Three, send radio, receipt, AND software back to Yaesu USA. They will restore it to original state under warranty.
Of course, you can do the MARS/CAP mod (don't transmit on frequencies you are not authorized for) and get MOST of the original functionality restored; all the original receive capabilities (and then some) plus the extended tx. ARS, alas, is no longer an option.

Got it and like it. Things I find interesting:
Small heat sink compared to other small radios.
The fan appears to be timer controlled, not thermal.
Even with the fan on the radio quickly gets too hot to the touch in back, even in the low power mode.
I use the dual band repeat feature a lot, and am a bit annoyed that the lowest power setting is 5 watts (I'd prefer about 200 mW) with no documented way to adjust it. This would let me use the handy around the neighborhood and not overheat the FT8000 at home.
The wide band receive is nothing to write home about. All I've ever received here in Houston on 220 is aircraft band 2nd harmonics.

In spite of this, I like the rig.

Editorial comment: I've yet to find another radio as packed with user friendly features as my FT530 HT. It's annoying to have to buy a $65 toner decode board for a mobile rig when it came standard on my '530.

If anyone has the mod to turn down the low power setting, please email!

2118. FT-50R MOD differances

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-04 00:00:00 UTC
From: tsarah@gwis.com
Message-ID: <4u2s7f$pv9@gwis.com>
Source record: 196458

I have tried some of the mods for the FT-50R that I have seen posted
on this newsgroups and I'm seeing differant results than those listed.

First of all the "Internal Systems Alignment" MOD:

After pushing LAMP, PTT, KnoB, and PWR at the same time I do not
get the "BAND xxxxxx" display. I get "ALRST Pr 5", if I turn the
Knob the radio goes back to the VFO that I turned it off on. I'm
going to assume that the Pr 5 is telling me that the max watts are
5. Also, if you push the Knob with the ALRST displayed it goes
back to the VFO.

Second, the "Extended U.S. Receive" MOD:

If I do as instructed and hold down the Knob and LAMP while
turning on the radio, I get the same thing as above "ALRST
Pr 5 F".

Now my serial number begins 6F04...., did they make some unknow
modifications to later models?

Thanks for reading this.
I have a Heathkit HW-104 80-10 mtr
HF rig with the SB-604 power supply
The PS has the opt 600 speaker kit installed
and the unit was inspected and optimized in May,
by a Heath bench tech that now lives here.
I have gone digital, and this radio won't do
for the equipment I have. I would consider
a trade for a newer HF rig with digital
capability.
I am asking $400.00 plus shipping.
Thanks

>hello, I would like the mars freq. so I can monitor them in the times
>there is no conditions on the band I'm working.

Well, it depends a lot on which band you want to monitor, and which
service (Army, Navy/Marine Corps, Air Force) you want to monitor.

It also depends on wheather you want to minitor HF packet, g-tor,
amtor, or clover, HF voice nets, VHF packet or voice, etc, etc, etc.

As many MARS operators have purposely set their antennas up for a high
angle of radiation, (to facilitate in state communications) it would
also help to know what state you want to listen to.

Best of all, why not get involved? I would be happy to give you tha
name & address for your State's Army MARS director who can lead you in
the direction YOU want to go.

2126. Please Help with 10GHz Microwave Gunn Diode Assembly

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-04 00:00:00 UTC
From: sidener@crunch.nuc.umr.edu
Message-ID: <4u3800$rp@hptemp1.cc.umr.edu>
Source record: 196466

Hi, I need some help fixing a Microwave Associates 10GHz Gunn diode assembly.

the model is : MA 86656 CM

I have two of them and I am trying to make a amateur data link but one of them has no output when I apply the voltage to the diode. I noticed something rattling around inside the assembly so I took out the plunger which holds the Gunn diode and found that it had slipped out of it's holder (probably from being dropped). I replaced the diode in the holder and tried to fire up the assembly again. Still no output. I do not know which way the diode goes in so I tried both directions (there are no markings on the diode) Still no output.

I can only assume that the diode is bad, but I have no idea how to find another. It has no numbers.

If anyone has any specs or advice on obtaining another Gunn diode or the correct orientation, I would appreciate any help I could get.

I was told that one of these assemblies cost around $500 new, and I don't have that kind of "hobbie" money avaliable. So I would like to fix the one I have.

Thanks,

Scott Sidener N0WFL

I have a Yeasu FT-51R and I need to purchase a new battery. I have decided on the Periphex FNB-33. I also have the CA-9 charging stand and the NC-38B. I was wondering if I need to purchase a new AC adapter to plug into the CA-9 for to charge this battery.

I also need to get a way to use a regular outlet or a lead acid battery or maybe even a car cigarette lighter to powerr my radio. I heard something about an EDC-12? If anybody knows what to do, please help.

Thanx, Edward Reed (KB2ZKP)

I second this. By far the biggest drawback to the G5 is the battery situation. The batteries are expensive, low-capacity, and the lack of an audible low battery indication is a problem. There is a low battery icon in the display, which sometimes comes and goes on my radio. The DJ-580T had a nice battery low beep, so it's too bad the G5 doesn't have one.

Two other much less important problems with the G5 are:

1. DTMF Paging functions only for the currently selected band.

2. There is no full duplex on/off toggle. That is, there is no mode where the other band is muted only while transmitting. (The DUP function lowers the volume some, which is useful when using the radio in cellular phone style with the speaker next to one's ear, as I do with a full duplex autopatch.)

Oh, and I should add a third problem: The antenna is poor relative to antennas that come with other handhelds (especially compared to the one that comes with the Standard C558A).

But, I still like the G5 a lot!

2135. Icom 2GXAT Internal battery?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-04 00:00:00 UTC
From: Peter Stuckey <pmstuckey@ualr.edu>
Message-ID: <320578DD.6295@ualr.edu>
Source record: 196475

I have an ICOM 2GXAT.. I have been really happy with it until lately
when
all of my memory settings (including the internal settings: offset, tone
etc) were wiped. I have not been successful at storing them, ie as soon
as I turn off the radio wham.. they're gone...
Anyway, I don't see a battery on the schematic and don't see anything on
the inside that looks like a battery... Does anyone know how the
settings are normally stored? I would appreciate any suggestions.
Please reply here or email me at:
pmstuckey@ualr.edu

Thanks...

-converts to the standard speaker/mic jack. I am looking for the connector
-itself.
-
-Rob WB8WQA

Ham Radio Outlet carries them. It's a mini-plug, with the standard
dual-plug output. It clips to the antenna, and can't be used if you have
the rubber gasket around the outer edge of the radio.

You can bet Kenwood already set the radio at a safe clean power.

I'd want more than 4 percent headroom to handle temperature, component and load variations.

But at least you checked it out. Cranking up a radio without checking it on a spectrum analyzer is a stupid thing to do, but becoming more popular.

Don't think you're going to find one very easily. :-(

But, in another newsgroup, someone who was bragging about trying to
"modify" one blabbed something about cutting away D12, and someone else
came back and said that D12 was for reverse voltage protection. So I'd
take a look at it first and see if that's the problem. Maybe it blew out
in such a fashion that it's now an almost dead-short even when fed
properly. In that case, it WOULD get hot fast, and there'd be no power to
transmit.

Good luck!

:
:This approach was tried with CB. Originally you had to have a simple licence for CB.
:Gear was too easy to buy and the CB band and later the frequencies from the top of
:the CB band to 10 meters was destroyed by illegal operators. The residue (ham rigs
:on 11 meters, VFOs and amplifiers) is still with us today. Unfortunatley it will
:not take very long for this to happen to all the popular ham bands which have been
:created by almost 80 years of dedicated effort. The Kenwood approach will actually
:destroy the ham bands not save them.
:

Destroy what? The FCC destroyed 11 meters by placing the CB band there to begin
with. They didn't account for the fact that skywave happens on 11 meters- then
when the conditions opened up, the band opens up into a free for all- thus
impossible for the FCC to maintain any order whatsoever. To be perfectly honest
with you, anyone who has the money to buy a kenwood, is going to get one anyway,
wether its at a gas station or though mail order. The CB would still be in
order and not be chaotic if they placed it on UHF(what was class A). No skywave
there to annihilate the RDF equipment.... other than tropo maybe. Besides, HF
will roll over to the more "important" UHF bands such as 1.2GHZ and beyond- this
is the real space that needs to be preserved for amateur use, as it will be
assaulted by large corporations and the governement, and where talking MHZ of
space here, not just 400KHZ or so of frequencies being occupied by 4 million
unorganized rednecks with no backing at all.

Hi Jon,

I have an Icom W21AT and use it for CAP work. For that it needs expanded receive of the manner that you suggested. The TX mod already performed on your radio is a hardware mod and will not be affected by the keyboard mod for expanded receive. I have included the text file below that explains how both mods are accomplished. Enjoy and luck.

Glenn Reed, KF5XB
CAP - OKWG/DCA

==========

NOTICE: Icom can not guarantee specifications when expand frqcy.

Receive only expansion:
---
1) Turn radio off
2) Press [B]+[#] switch and turn ON radio.
Depress [B] and [#] only when the display shows all functions and
the radio emits a beep.
3) Go to SET mode and a new function will appear after TONE selection.The
new function is designed by PL. Set PL to "1"for 1 MHz frqcy. enter,
to 10 for 10 MHz frqcy. enter and to 100 for 100 MHz frqcy. enter
resolution.

Note1: This modification does not reset information saved on the CPU.

108,0-135,995 MHz AM (aviation band)
136,0-299,900 MHz FM
for the VHF portion;

300,0-999,900 MHz FM for the UHF portion.

REMEMBER: It is illegal to listen cellular fones conversations!
Some frequencies are not allowed for listening. Those
restriction varies from sate to state.

TRANSMIT EXPANSION:
----
1) Call Icom Parts Dept. and order one diode MA132WK (D.23) for IC-W21AT,
Symbol: MU;
2) Open radio and localize the logic unit;
The logic unit is the half portion of the radio that contains the CPU,
display, keyboard, etc...;
3) Localize some orange colour components in the lowset right part of the
portion, below the CPU shield plate.
Localize the smallest orange colour component. Note a empty place for a
surface mount diode (3 dots) near this orange component (see draw below);

```
------\ : . <---- Empty place for surface mount diode MA132WK
|oran- \ -----------| | DIAL button
| ge / :<>. <---- Surface mount diode | CPU | |
----- / mounted | Shield | | U vol button
^ | Plate . |
| . . | V vol button
|Smallest orange colour component ------|------------|
---PTT,F,Moni..
```

4) Add D23 MA132WK diode in the empty place.
Do use very fine soldering iron and temperature controlled gear.
The circuit is very fragile and may burn if excessive heat is applied.
Take care for static damage also; If you can, use professional gear
for this purpose or find technical assistance of your choice.

Note1: It is illegal to transmit out of band without an appropriated
license for MARS/CAP.
Note2: Icom does not guarantee the mod nor the specifications;
Icom and the author don't take any responsibility if any damage
occur while performing the mods.

-FULL CROSS BAND REPEATER OPERATION-
This feature enables HT to receive on one band and retransmit the content to
the other band. You can even choose tone squelch selections, repeater offsets
and many other features available during normal operation.
1)Select frequencies on VHF&UHF and options (tones, DUP,...);
2)Set "key lock" by pushing [F]+[C] keys. Then turn radio off;
3)Push [F]+[MONI]+[RPT-M] keys and while holding them pressed, turn radio
on. You will get flashing "L", telling you cross band rpt. is enable.
4)Press [F]+[C] ("key lock" release) and you will clear the cross band rpt.
mode.

Hello All

I am interested in purchasing a Standard C5608D dual band transciever.
How soes the unit perform, are they reliable ?!?!?

Any information/opinions wanted and gladly accepted.

Also, I see that there is an optional ctss pcb for it.

CTN5600 Are they easy to obtain ? How much are they ??

Finally, I noticed you can extend the mike circuit by 4 meters so you
can out the radio in the boot. Does that work well ?? Can you make
your own cable ????

Geeze, full of questions aren't I !!!

Thanks for any help you may provide.....Pete..vk2yx

I've had a '730 for about 12 years and it is one fine radio in my opinion. It doesn't cover 160 meters but that's about my only gripe. The light bulb behind the meter burned out a couple of years ago and the mike voice coil opened up for some reason. Icom supplied me a new voice coil for about $11 and Radio Shack had the lamp for about 50 cents. Other than that, it's been great. $450 is a good but not great price. I've seen them for $400 or so.

I ran it mobile for many years and it now is my second radio for contesting.

Hi all!

I just purchased a new Kenwood TM-251A mobile rig. This rig has a dedicated 1200/9600 baud packet connector on it. I have a Kantronics KPC-3 TNC.

I want to use the dedicated packet port on the rig, but I can't find a premade cable that will properly interface my TNC with the rig. (I'm starting with 1200 baud operation.)

Does anybody know if there is any store or individual that sells these cables premade, or has anyone already built it for themselves. If so, can you please give me some tips on how to do it!

I already have the Kenwood PG-5A Data cable with the 6-pin DIN connector on one end for the rig. I also have the parts for the 9-pin serial-style plug that came with the TNC.

Also, if I build it, is it just as simple as connecting the wires, or do I have to change the line voltages?

Thanks in advance!

Another thought -- just use IPHONE. Although it would be a 1-at-a-time
deal, it would be easy to do. FWIW, I've been talking to a group of
hams back in the USA via IPHONE and some control software called
REPEATER LINK. I can even access their repeater phone patch using a
midi DTMF simulator to place local calls to my folks. Of course, this is
not exactly private since the call goes over the repeater, but it sure beats
paying 3 bucks per minute for a quick phone call back to the states.

Talked with some other guys using CW via iphone....sure works better since
propagation is lousy.

Lots of neat applications using IPHONE....check them out.

You may also be able to find a used METRON MA-1000B. It was designed for 80-15M, but can be readily modified to support 10M as needed. It requires 12-14VDC at 90A, and will output 500-600W when running from a suitable power supply. Requires about 50 watts drive.

This should be an easy one, but then those are the ones that attract the most flames. I have owned an Icom IC-2AT for about 14 or 15 years. It still works and is being used now as part of a portable digipeater system. It is a time proven performer. I have also owned an RS HTX-202 (I presume that is the one you meant). I have used it as a portable/mobile unit in rental cars when on the road.

Here is how they stack up. The 2AT has a significant edge with the Icom name and its own track record. However that is about it. The 202 has proven itself to many users despite the controversy of it being an RS product. It is capable of higher power, keypad entry, memory channels, CTCSS, and more. It is based on technology that is now only 4 or 5 years old vs. the 2AT which has been on the market for about 16 years.

I own (counting my wife's radios) 9 2-meter radios. One is the HTX-202, one is an antique Drake portable (about 22 years old) and the other seven are Icom. I have also owned a variety of others including Yeasu, Kenwood, Galaxy, and probably several other brands in the last 23 years of ham radio.

As you can see, I have a fondness for Icom. However, in this case, I would not hesitate to chose the HTX-202. One other thing I forgot to mention is that if the Icom needs service, you can plan on 4-6 weeks turnaround from Icom for the repair. If the HTX-202 breaks, RS will usually have it back in less than two weeks.

2173. HTX-404 ER2 help please

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9608050010261410@atdbbs.com>
Source record: 196511

>>...ER2 on the HTX-202...

HTX-202 Error Codes (taken from a Radio Shack memo)

ER1 indicates an internal RAM error. It appears when the memory backup battery is dead, when something has caused the memory contents to become corrupt, or as a result of physical or static electric shock. To clear this error, turn off the unit. Then turn it back on while holding down the "function" and "D" buttons. This clears the memory. If the error returns after you clear the memory, service is required.

ER2 indicates a PLL unlock. The radio gives this error if the PLL alignment is off or if the transmitted signal interferes with the internal PLL frequency. This error has been reported most frequently when using the supplied "rubber ducky" antenna with either a high-power battery pack or with an external DC source.

According to the memo, the fix for this is to use an external antenna when using external DC power. The memo goes on to say that if the problem persists, send the transciever to the repair center.

Excuse me. I guess what I meant to say was:
For FT50 adjustments, check:
http://members.gnn.com/hca/ft50/ke6vvw.txt
The HIPO setting can be adjusted above 5watts.

And into a dummy load with 13.8V into the radio, the FT-50
will have a VHF power out of 9Watts or maybe greater. The radio
will draw over 2Amps at the 9Watt level.
With the radio adjusted with 9.6V in, the VHF power out should be adjusted
to 5Watts. The current draw should be around 1.5Amps.
Settings for the FT50 may come out around the following:
HIPO 5.02W 170
L3PO 2.50W 109 (I picked 2.5 since it is 3dB down from 5.0W)
L2PO 1.02W 62
L1PO 0.101W 18.

That depends on what you want in a radio. If you like high tech, scanning, pl, etc., then the 202 is for you.

If you like a radio that works great on packet, has great resistance to intermod, is super tough, then you want the 2at.

Also the 2at can be used from 140-149.995 tx/rx and can be modified to a new band of 150-159.995 quite easily.

The 2at also puts out far more audio from the speaker than the 202. That might be important if you are going to use the rig in a noisy enviorment.

The 202 is smaller and "really" can be put in your back pocket. The 2at will go there, too but if I falled on my butt the 2at would survive - the 202 might not. The 2at works good as a mobile because the controls are on top. I just made a cross country trip with the 2at on my sun visor. It worked nice.

Tough decision?

The Kenwood TR-2600A is a good radio. I have been using mine as a
dedicated packet radio for a while now. It performs well. The stock PL
board is no longer available but you can purchase a replacement from
Communication Specialists for under $30. If the price is right buy it!
Hope this helps. 73

> But then to each his own.

> Later..Chip

Yes, Aubrey, Chip is correct. This is a fine little unit. There does
seems to be some problems with reception strengh and quality in the
WFM frequencies. I have also found several birdies in mine and others
have complained about the rubber that surrounds the PTT and other
places.

Overall, I'd like to have another, but the WFM is a major consideration
(all respects to Chip and his idea regarding use of a Walkman).

Some of us live in seismically active regions (or where other disasters
have a high probability) and use amateur radio first and foremost as
a means of emergency preparedness and response. In this utility,
reception of emergency TV broadcasts, or monitoring/scanning of
public service frequencies is not a minor consideration, is may very
well be a necessity.

I have personally found it very useful to know where and when my
emergency support is going to arrive when I'm the first/only/support
responder on an accident scene (my commute corridor is VERY
hazardous and public service is very slow because of the road
configuration. I end up being a first responder about 1-2x year -
last one required a medivac chopper).

Overall, it's a great unit. I hope that Yaesu can work out
the rest of the (small) kinks in it..

From: timh@xetron.com
Message-ID: <Dvo6Hz.D2J@xetron.com>
Source record: 196524

ALRST PRS F
Is All Reset?? Press F
Pressing F when ALRST PRS F is displayed will reset the radio.
BTW, those aren't MODS that are posted. Those are the internal
settings for the Alignment. The settings are kept in a
EARoM and can be erased if the radio is dismantled and the boards
separated.
Also, raising the TX PO to above 5Watts may prove more harm than good.
Well, it looks good on the Power Meter if such a little radio is TXing
7 to 9 watts, but the heat that is generated is not vented to the ambient
surroundings. More often than not, the battery is in place, keeping the
heat inside the radio.
Also current consumption increases to over 2Amps.
The FT50 may not have any thermal grease under the power amp bricks. The
metal chassis is actually metal, not plated plastic, but the chassis has
a 'lemon peel' finish. The mating of the power amp brick with the heatsink
doesn't appear to be sufficient without thermal grease. (another reason for
leaving the HIPO setting alone)
Anyway good luck, and don't burn your hand.

Actually, It's a PTT lock problem. As in the transmit button does't quite connect when you press it down. If you hit the PTT a couple times, the message will go away.
Just tryin to help.

I too have had no problems with "falling off" of rubber parts. My
FT-50R is built like a tank. I too am curious about what type of
treatment the radio endured to have the part "fall off". Just my 2
cents. 73

: Does someone have a copy of the USA template file they could
: post or email (UUencoded, of course) to me?

: (It probably doesn't matter when using a template to reset to
: USA mode, but my FT50 does *NOT* have the MARS/CAP mod.)

Thanks to Rod Thompson at RT systems, I _was_ able to recover the
radio. The solution was to use a win3.1 system rather than NT to
run ADMS-1C. Apparantly there's a flow control or timing issue (I'm
guessing -- ask Rod!) which will cause the headaches I have had.

Keep this warning in mind -- don't use a WinNT system to run ADMS-1C.

2194. ft50 wfm fix

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: "Stephen E. Marshall" <smarsh@tiac.net>
Message-ID: <32062DAA.51C5@tiac.net>
Source record: 196532

I don't think there is ANY fix for this inadequacy in the ft50. In the big review of the rig it mentions "wide band fm" is a bit more hype than reality as all of us who own it realized. Apart from that, it is a great little radio! If you haven't, get the ADMS-1c software program for your computer, comes with cable to the radio, good manual, intuitive usage and a lot easier to fully program/clone/change than twisting the knob and squinting at the display. HI! My techie friend who knows everything about modifying and does it professionally said wb fm is NOT possible with this rig any wider than it is now. Good luck <N1FSK>

Thanks for the note..... But in this case it seems that the
keyboard was indeed the problem. Just had it replaced and
that fixed all of the key bounce problems. It did not appear
to be a control problem (i.e.intermittent connection of a
row/column scan line).

It's nice to know that Kenwood monitors this newsgroup!

You are probably referring to the newer model, HTX-242.
I have the older one, HTX-212 and it works great. It has every feature
that I wanted, at a pretty good price. One thing that bugs me in the 212
is that you can't store a non-ham freq in memory. But I heard that the
242 has fixed this limitation.

Hallo PR�s

Ich besch�fte mich schon seit einiger Seit mit Packet Radio. Zur
�bertragung benutzte ich das einfache PC-Com Modem von Conrad
(Betriebssystem DOS).
Nun m�chte ich das ganze auch mal gerne unter Linux versuchen, habe
jedoch noch keine Erfahrungen mit PR unter Linux. Mich w�rde nun
interessieren mit welcher Software man unter Linux arbeitet und auf
welchem Server ich sie finden kann.
Ein weiteres Problem ist auch, da� ich f�r mein Modem einen
"tfpcx.exe"-Treiber brauche, um ein TNC zu simulieren. Gibt es f�r
Linux auch ein Programm, welches diese Aufgabe erf�llt ?

F�r jeden Tip oder Hinweis w�re ich sehr Dankbar.

David

2209. How to make the Ar-2000 receive cb's 40 AM channels?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: chd1589@teche.cacs.usl.edu
Message-ID: <4u5maq$jc2@rouge.usl.edu>
Source record: 196547

I recently bought the AR-2000 from Copper's catalog.
I thought it could receive the 40 channels that normal cbs transmit.

Is there any way to modify it so i can receive those 40 channels.
oh by the way, The radio receives 28.00-29.90.
Please send any suggestions to chd1589@usl.edu

>>for a ful charge ???

>>I have these bats:

>> Model PB34 (9.6V/600mAh)
>> Model PB32 (6V/600mAh)

Sorry it took so long.

On the charger that came with the radio it takes 15 hours for the
PB-30,32,34... It takes 30 hours for the PB-33.

With the quick-charger (KSC-14) it takes 60 minutes for all packs
except the BP-33 (70 minutes)..

Hope that helps.

Now that IS interesting. I was using Win95 (let's not start THAT debate here) and had results like you had using NT. We've got 3.1 installed at work. Maybe I'll have a go at it there. Thanks.

2215. Review of ICOM CS2710 Pgming SW for IC2710

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: Rick Gilligan <rgilliga@case.net>
Message-ID: <Pine.GSO.3.95.960805203408.11096A-100000@spork.callamer.com>
Source record: 196553

I just finally received the CS2710 programming software for my IC2710H dual band mobile.

A few warnings for those considering buying this software.

Unlike what most dealers seem to think, the cable is NOT included in the price (about $28 for the software). If is a separate $71 item!

A bit pricy compared to the cable and software for the new Yaseu FT-50 handheld.

There is a level converter in the shell of the DE-9 connector. I suppose you could build your own... but read on.

Once I received the cable, then the real problem began... I had remote mounted the radio in a difficult to get to spot in the rear quarter panel of my SUV, behind an interior trim piece. Silly me, I had assumed that the cable would plug into the RJ-45 style 8 pin connector that the mike uses... that would make it easy to plug it in on the end of the mike extension I built. No, it plugs into the 4 pin connector (that is a bad word for what it is) that interconnects the radio control head and the main unit.

The programming cable (OPC-646) will NOT mate with the control head end of the extension cable which interconnects the head and main units when the main is remote mounted.

The only reasonable solutions are to either pull off the panels to get to the radio and then hope you left enough access room that you don't have to completely remove the radio from the bracket to remove the control head cable and replace it with the programming cable. Or, cut the remote cable, put a 4 pin connector on it, then put a 4 pin connector on the PC side DE-9 portion of the programming cable so that you can switch between the control head and the programming cable (or use a 4pdt switch).

The later requires finding and preparing a suitably reliable connector. In my opinion, connectors are always the weak spot in a system.

With these caviats, I do recommend the software, the programming of the radio was easy.

The software is reasonably well written.

It runs under dos (a dos window under Win95 worked fine).

You can program all of the items which are also front panel programmable. I noticed no hidden features, even a quick scan of the strings of the program and overlays yielded no interesting information.

The files, as saved, are some sort of printable character encoding of what I assume is a direct memory dump of the internal memory. Perhaps some other hacker (and I use that in the 70's sense of the word) will reverse engineer the file format. Maybe it is possible to load frequencies outside the normal range into it (and I mean even beyond the extended receive which is enabled by cutting a diode).

The user interface isn't bad, the number of extra keystrokes compared to a better design gets old right away, but it is reasonably serviceable. Those of you who have ever used Rotomola's programming software will be pleasantly suprised, the rest will just put up with it.

The only minor bug I found: when retrieving the existing programming from the radio, if you have one of the band scan edges programmed and one empty, it puts the next band scan edge in the wrong channel location.

I use the three lower scan edges are additional call channels, so I just duplicated the lower scan edge information into the upper scan edge channels.

So, it is pricey, however, very handy.

A friend who had repeated trouble with his IC2700 wished it had programming software, every time he sent it in for service, it took over an hour to re-program from the keypad.

I agree that CB is already destroyed. My concern is that if Kenwood (or other rigs)
are sold at truck stops, then all the HF bands will be destroyed just like 11 meters.
It would only take a few months.

Hi all.

I found something that I think will interest all you
FT-50R/40R/10R owners out there. Yaesu's land mobile division, Vertex,
has come out with an HT identical to the 10R/40R/50R's. Same case, same
features, same charger. Except.

The Vertex VX-10 has a 102 channel keypad that includes voice
encryption!! Factory list is $70 for the pad.
Also the antenna seems, from the ad's I saw, to be more rugged looking
than the ham version. Now if they could just make a simple drop in rapid
charger.

Vertex (310) 404-2700

Dealer: Henry Radio. I forget the URL for Henry's. Try Yahoo/
Henry/Radio.

Could someone point towards info on how to broadcast on FM radio.
I've heard it called free radio or pirate radio. Does that mean it's
illegal (how illegal:)? What makes it illegal (in florida)? Where can I
buy the equipment? What would I need to buy? I just want to transmit 5
to 10 miles and just music (mostly my own and my friends music so as not
to violate copyrights or whatever).

To discuss whether the band is dead or not, does not really solve a problem.

> I splice the coax, solder one end to a length
> > of wire 8.2 feet and the other braided end to a length of wire the same
> > size.

here is your problem. A dipole is a symmetrical antenna, while the coax is asymettrical. Secondly, the impedance of a dipole, whether open or folded heavily depends on the height above ground (measured in wavelengths). I agree that the height of 8 foot (which is 2.4 meters if I am correct), is by far not good enough. However, with proper matching (asymmetrical/symmetrical or BALanced/UNbalanced = BALUN, see your manual) it should be possible to get an SWR of 1:3 which is good enuf to work with.

> I suspend both ends using insulated clamps between two tree's,
> > making sure that the whole antenna is parallel to the ground and it's 8
> > feet above the ground.

Try using trees further away and use for the extension of the wires nylon line or at least several insulators. An insulated clamp is just a capacitor for HF energy. Experiment with trees at various distances and various hights !

2224. Re: Halicrafter radio

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: David Kao <dtkao>
Message-ID: <4u5r7e$je9@hpindda.cup.hp.com>
Source record: 196562

ver the weekend I went to help a friend to clean up his garage by taking over some of the stuff he collected over 10+ years. He unloaded a radio to me. It is labeled as a helicrafter radio. It looks like a transceiver of 80M, 40M, 20M and 10M bands, including CW, USB, LSB and a few others. The radio is nearly 50lbs in weight, all tube and is in quite good shape. It was all covered with thick dust. After I blow it with compress air it looks in fairly good shape.

I turned on power for about 15 minutes and it did not explode or catch fire or anything like that. All tubes heated up and all lights went on. I did not hook up a mike nor an antenna. No lablel indicating how much transmitting power it has. There are a lot of knobs for all sort of tuning. The frequency dial shows a lot of bands on it. There is no channel switch but a band switch. So I guess within a band, tuning of frequency is continuous. If the freq dial is off then there would be no telling if it is on a channel correctly or not.

Anyway, has anyone heard of such a beast? Is it a worthwhile piece of equipment?
Or is it merely a junk? It will consume 370 watts of AC power. Is it worth trying to restore it to working order? Was it a good radio in the first place?

Any info regarding this beast is much appreciated.

David

Kudos to the folks at RT Systems for selling a great product at a reasonable price! ~$40 is certainly reasonable for software and cable. A friend bought the Icom programming kit for his IC-2710 and spent over $80 for the cable only, software was another $30.

Motorola stuff (different league) is insane. $200 for a cable, $200 for a programming box, and $250 for a software license is not uncommon.

Give the folks at RT Systems a little of your hard earned money and pick up this thing.

I don't work for RT Systems, I'm just a satisfied customer (who would be even MORE satisfied if they'd develop a Macintosh version).

Does anyone have information on an Eico model 625 tube tester? I just acquired one of these since I work on a lot of tube equipment, but I didn't get any manuals with it. Here is what I would like to know: What do the underlined tube pin numbers in the information scroll mean? Are there any test data on tubes which are not listed in the scroll (e.g.: type 80, 75, etc)? Any help would be appreciated. The previous owner gave me a crash course on it, so I understand how to set the switches and pots to m
ake it work.

2229. Radio Shack HTX-212 modification

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: sherman@marconi.w8upd.uakron.edu
Message-ID: <4u55e8$bff@kira.cc.uakron.edu>
Source record: 196567

I have a R/S HTX-212, and I did have to mod it to use our 145.17 repeater (negative offset). It's not hard to do, and I admit I was a little surprised you had to do that, but I love the radio otherwise. It can survive the intermod in downtown Akron, Ohio, and I got it on clearance.

2230. Uniden HR2510

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-05 00:00:00 UTC
From: Jim S <Saeger@gat.com>
Message-ID: <3206D53D.5F87@gat.com>
Source record: 196568

I have just recently purchased a Uniden HR2510 10 meter mobile and most everything that I havebeen able to find on the net about this radio is positive (or at least not negative) so I hope that I will not be disappointed. I bought it for the 10 meter mobile coverage (i.e. not interested in it for CB, I have other radios that do that just fine) so if 10 meters is all it can do on the Amateur Bands, this is fine also, but some of the net comments that I have read now leads me to believe that it can be easily modified to do 12 meters also. I have not seen a schematic or discussion about this.

DOES ANYBODY KNOW?

A: "Can the HR2510 be easily modified to get to the 12 meter band?" I am talking about processor or reference crystal changes (or something else?) but not something that significantly changes its 10 meter performance.

I am aware of the well published processor pin wiring changes that "opens up" the frequency range down to 26 MHZ, but this is not far enough to reach the 12 meter band (i.e. I need to go to down to about 24.9). I have read comments about "Chipswitch"ed versions of this radio that apparently do reach the 12 meter band (ref. Durham Radio). I assume that "chipswitch" refers to changing the processor (or some other chip?).

B: "What exactly is "Chipswitch" and what frequency range will the radio have if thismodification is performed?"

No rush.. No high mufs in the near future ... not into packet... and I do not intend to do any modifying until the warrantee expires, or at least until I am sure that I am beyond risk of sudden "infant mortality" syndrome.

I am quite new to the net so if this topic has already been covered, perhaps someone could E-mail the answers.

Thanks... Jim.... WA6SEW.....

Norm <norm@cqg.com> wrote:

>My monitor causes considerable QRN with my TS-440 on 20 meters. Is there
>any way to eliminate this interference? email norm@cqg.com

Norm , I am assuming you are talking about a computer monitor. If
that is the case, you have a problem that can be very difficult to
solve.

First try to filter the AC power line from the AC line to the monitor
with brute force line filters. If that doesent work (some times it
does and somtimes it doesent) then try ferrite cores arround the cable
from the computer to the monitor.

One tip that helped me find and isolate the problem of computer noise
in the rig, was this. Get a length of RG58 coax and put a PL259 on
one end. On the other end remove about 1" or so of outer shiled and
braid. Remove about 3/8 to 1/2" of dialectric to expose the center
conductor.

Now plug this cable into the antenna input of your rig, and use it as
a noise probe. Sniff arround all of the computer cables, the case and
the electrical outlets. DO NOT TOUCH any of these components with the
probe! Just get the bare end near them. You should fine the sorce of
your noise very fast with this.

I hope this will be of some help to you.

Mel,

You've gone too far already. That 8 pin din is different and Kenwood and Yaesu parts have the mating plug. The Kenwood part no. is E07-0851-05. The socket on the radio that is now damaged is E06-0851-05 if you want to replace it.

The parts can be gotten from East Coast Transistor who's phone # is 1-516-483-5742.

I'd suggest that you not keep the extended transmit unless you have a MARS or CAP permit. Whether you have a valid license in the Business Radio Service or not, it is illegal to transmit on those frequencies using an amateur HT. The FCC requires that ALL transmitters in the Part 80 and 90 radio services (Marine and Industrial/Public Safety) MUST be type accepted, and one of those conditions is that the operator must not be able to adjust the transmitting frequency. Amateur units are NOT type accepted and cannot be modified for type acceptance.

I am guessing that the ADMS software is covered by copyright, and
that posting and using it like that would be illegal...

Be that as it may, the cable you need to hook the serial port to the
ear jack is not a trivial affair. There are a lot of surface mount
xistors, resistors and diodes in the 9-pin cover. You will need it
too..

I am also a happy Icom 2GXAT user.

Try resetting the usable memory channel number. It could be restricted.

Also, try to do a partial reset (push [f]+[H/L], turn the power on), or a total reset. ([F]+[H/L]+[DUP]+[V/M/C], turn the power on while holding these buttons.)

As for an internal batter, I have no idea. Maybe there is a static buildup problem?

I'm interested to know how it turns out. Good luck!

Having an intermittent fail on my TS-790A . At what appears to be
random intervals the radio audio disappears followed within seconds by
the clearing of all 50+ memories. Turning the rig off for a few
minutes restores the audio and reprogramming the memory returns the
rig to normal operation. I've checked for faulty capacitors and bad
voltage levels but found none. The only anomaly is the PLLs were badly
out of alignment. Had that problem fixed and the rig worked well for
all of 48 hours before showing the same symptoms. Any ideas?

: fellow, and he was shocked about it not having marks for plate/grid
: settings, and couldn't figure it out. so if anyone knows of a Swan
: specialist up here, a name and number where I could reach them would be
: nice.

What do you mean "marks for plate/grid settings"? Do you mean, average tuning ranges for the various bands? If so, why are they necessary? The directions tell how to tune the rig without them.

If you mean that the four knobs in the upper right part of the panel are unlabeled, then you need to find a local tech who is a bit more intelligent. It is not hard to figure out which is which.

The upper left is PA Plate, the lower left is PA Grid. The upper right is coarse load and the lower right is fine load. This is true on every Swan that I have ever seen of the 200/500/700 series.

Source record: 196387

Being used to separate receiver and transmitter, I am acclimating to transceivers. Got a nice Kenwood TS-940 but desire separate receive antenna (especially for 160 meters). So I am working on the necessary connections to the 940 and switching.

The 8 pin DIN socket on the back (transverter socket) does not seem to align with the 8 pin DIN plugs I bought at hamfests. In fact, trying to push the plug in caused the plastic of the socket to spall away.... and the outside pins of the plug (closest to the alignment ridge of the plug) bent outward... indicating a severe misalignment. Not being familiar with DIN equipment, I decided to stop right there and ask for help.

I know there are Kenwood users out there who have 8 pin plugs in these sockets. Anything special that I need to know? If I have to, I can heat the plug and do some plastic surgery to realign those two pins to fit.... but is there a different 8 pin DIN plug that I should be using? (Kenwood maual not specific)

Anything else I should know about a second receive antenna on the 940 that is not in Kenwood's manual?

thanks for reading

From: adam@tbsa.com.au
Message-ID: <4u7i9c$gp4@news.tbsa.com.au>
Source record: 196389

Howdy .

What exactly is Yaesu's new FT-600.

A new 6 meter box? - I hope so!

When will someone finally release a 6mx transceiver
with all the high end features like DSP etc that only
wind up in HF transceivers???

Any info - please email me.

Cheers,
Adam VK3ALM (UKSMG #843)

> 73s
> Abe
>
> KE6OCM
> --GMRS stands for General Mobile Radio Service. Basically it is an upscale UHF CB band that is utilized by mostly fairly upstanding people, at least in this area. REACT a CB public service origization utilizes GMRS. The intent is personal communications for personal and small business usage, but the FCC seems to be getting away from the business aspect of GMRS.

Frequency pairs are in the 462.xxx to 467.xxx mhz range with repeaters allowed. All units must be licensed by the FCC just like the business band radio service, using the same FCC application. So a little work and know how goes into the application. As with business band all equipment must be TYPE ACCEPTED by the FCC, therefore ham radio equipment is not legal for this service.

In most areas 462.675/467.675 is monitored by REACT for emergency calls for help. I believe there are 6 to 10 frequency pairs available for repeaters and a whole bunch of inbetween low power channels available for simplex. No autopatch interconnects are allowed, but I believe the FCC is looking into allowing them.

In another related matter, the FCC has approved the new "FAMILY RADIO SERVICE" This is a low poer service for short range communications. More frequencies are sandwithed between full power GMRS channels in the 462.5625 - 462.7125 frequency band. Radios need to be type accepted and should be available by the end of the year holiday shopping season. I don't know if you need a license for this new service or not.

In my opinion, with these frequencies tightly compacted next to GMRS high power repeaters, the intermod and channel splatter could be a big problem, but then again, this service I believe is intended for very short range communications.

I'll post more as it comes available.

2272. AR8000 FILTER MOD DETAILS

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-06 00:00:00 UTC
From: wm8p@infinet.com
Message-ID: <4u8641$ceu@news1.infinet.com>
Source record: 196402

Hello AR8000 owners,

To my knowledge no one has actually posted a filter mod, here is what
I did. This is my approach and I only know it works well on my AR8000.
Your results may vary. Others may have a different solution that
works better or worse.

THE GOOD NEW:
Is it worth the effort. In my opinion YES!
The search mode is vastly improved on the SW bands. Search stops
on the primary frequency and not 1 or 2 times before and after.
Readability of SW stations is vastly improved. In some receiving
instances it reduces adjacent channel interference noticeably.
On AM receive for aviation frequencies a pronounced improvement in
audio quality is noted. You will be able to select WIDE or NARROW
for AM, NFM, USB, LSB.

THE BAD NEWS:
This is a difficult mod to perform. I have been a ham for over 30
years and have extensive homebrew experience. It took all my skill
and a magnifying glass to perform this mod without damaging the
radio. IF YOU ARE NOT QUALIFIED DO NOT ATTEMPT THIS MOD!
Find a qualified helper.

There is no way to adequately describe the locations on the circuit
board to be cut and soldered too. You will have to buy or borrow
a service manual.

Study the electrical mods described below and then using an ohm meter
and the service manual find the locations to modify on the circuit
board.

WHAT IS MODIFIED ELECTRICALLY:
The 4khz filter (F4) circuit is paralleled by a a jumper that is used
to bypass the filter for WIDE reception. This selection process is
accomplished by switching diodes on each end of the filter and bypass.

Find U2 pin 11 (AM, FM filter bypass) line. Trace this line to a 22K
resistor that connects to the switching diodes (near the F4 filter).
The voltage from pin 11 is used to bias these diodes into conduction.
Cut through the circuit trace at a convenient location just before
the 22K resistor.

Find U2 pin 4 (SSB, CW filter inline) line. Trace this line to TWO 22K
resistors that connect to the switching diodes (near the F4 filter).
The voltage from pin 4 is used to bias these diodes into conduction.
Cut through the circuit trace at a convenient location just before

the TWO 22K resistor junction.

Unfortunately there is no way for me to put a schematic in for this next part but if you draw it out on paper you should be ok. You are going to mount a small switch on the radio. This must be a DPST switch.

Connect a wire from the WIDE side of the switch to the single 22K point.

Connect a wire from the NARROW side of the switch to the dual 22K resistors point.

Connect TWO 1N914 style switching diodes together to the switch common.
Connect them with the black band facing the switch.
Connect U2 pin 11 to the open end of one diode and U2 pin 4 to the open end of the other.

What you have done is to install a switch to reverse the normal filter selection of F4. The 1N914 diodes serve to prevent turning on the BFO in the AM mode and to prevent grounding when in the WIDE SSB mode.

If you have questions you may email me but if you post a reply all may benefit. I make no guarantees, your results could vary. You might not have much fun performing this mod but you will enjoy the results.

Source record: 196404

I'm looking for an antenna solution for a 1969 Vette. Of course I don't want to drill any holes and an on the glass mount won't work on the rag top.

I've been thinking about putting an antenna in the factory hole for the am-fm antenna. I can put some aluminum tape on the inside of the body panel for a ground plane. But then the problem is I don't have an antenna for the stereo.
Has anyone seen any duplexers that would let me use one antenna for the ham bands and the bradcast stuff as well? If they made a low pass section that cuts off at 110mhz and a high pass at about 140mhz, it would be perfect.

Does anyone have any good ideas?

Thanks,
Dan Newby

Almost twenty years ago, I was working for a company in
California where one of the executives had previously
been an engineer at Collins Radio. He was also a ham.
Anyway, he told me once that the serial numbers on the
S-line and KWM-2 series were issued in a RANDOM order.
Therefore, he said, do not purchase used Collins rigs
based on the theory that a "high serial number" is
a new radio.

Anybody out there in cyberspace who can authoritarily
confirm or debunk this matter?

Feel free to post the answer here on this newsgroup, in case
others are interested as well.

Thanks & 73,

Source record: 196410

Howdy,

This is a follow up to my previous Internet posting sometime ago, regarding Tucker Electronics (Garland, TX) radio repair center.

I recently had the opportunity to deal with Tucker Electronics again, and I was pleasantly impressed with their commitment to customer satisfaction, and strive for good service.

My main issue was radio repair service, and Tucker now have a well established radio repair center. The data that I collected on their radio repairs history indicate that they have repaired more than 600 amateur radios with less than 10 reported problems. Also, they are an authorized Kenwood and Icom service center.

I decided to post this, because I believe in giving the credit to the people that deserve it. Tucker electronics met their pledge for customer satisfaction in my case, and I want to share this experience with all my fellow amateurs out there.

2281. R.S. DSPs now $30; worth it?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-06 00:00:00 UTC
From: slay@netcom.com
Message-ID: <slayDvqHou.MqH@netcom.com>
Source record: 196411

I am quite sure that this is an "old" topic ... but I never
paid attention before. ;-) While visiting my local Radio
Shack store today, I noticed that their DSP boxes, which
originally sold for around $80 are now on sale for about $30.

I have heard that they are virtually useless for "noise reduction",
but there are occasions when I wouldn't mind having one available to
take out some heterodynes on 40m SSB ... or ... can it take out
SSTV signals, too ... pray tell?

Thanks and regards,
Sandy WA6BXH

2282. TS-850S Mystery Menu

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-06 00:00:00 UTC
From: Sitler@uno.cc.geneseo.edu
Message-ID: <Sitler-0608961558290001@137.238.7.78>
Source record: 196412

The TS-850S has a &#65533;mystery&#65533; nine-item Power-On Function menu similar to the regular menu described in the manual. This &#65533;mystery&#65533; selection is activated by holding down the &#65533;Scan&#65533; and &#65533;TX M.CH&#65533; keys on power-up. It is cycled with the M.CH/VFO.CH knob and individual selections are changed with the Frequency &#65533;Down and &#65533;Up&#65533; keys. The factory settings for the selections are:

```
00 6972
01 OFF
02 OFF
03 OFF
04 ON
05 OFF
06 OFF
07 ON
08 OFF
```

Does anyone know what functions or operations are controlled or modified by these selections? Any help would be appreciated.

Are you ready? Sitting down? Vallium nearby? Good.

1. A Radio Interface Box (RIB) cost $150.

2. A computer. Cost <$500

3. Motorola software. Cost $350+

4. STX RIB cable. Cost $125.

5. Trunking info for local system. Cost ????$$$???

6. Time. Cost (Time is money they say)

If the above seems too expensive I strongly suggest selling the radio
now on the net. (No thank you I don't need one)

Good luck.
Matt D.

> radio isn't crippled.

Mistake? I'd hardly think so... more ARRL / RS bashing (I'm surprised at you, Gary).
A couple of key presses and the limitation is gone - stays permanently in memory unless
the unit is completely reset. I've had my unit for 1-1/2 years and no problems.

Have a good skip...

This thread is full of references to key presses in the manual. My manual has
a heading about extending the transmit range with no instructions afterword.
It is followed by a table showing factory settings and a warning box about
performing the MARS/CAP modification. No magic key presses, though.
There's only a short explanation on how to reset the radio by holding down
the F and T-SQL buttons while turing on the radio. Does anyone know the secret
key sequence? I'm actually more interested in storing out-of-band frequencies
in memory rather than the transmit mod.. The only hope I see is if there is a
software work-around through key sequences or something. Seems silly to me why
such a limitation exists if the hardware is already designed for wide receive.

Gary, thanks for your reply. I've tried all the business with standard power pack and a cpu reset, but the problem persists. I've ordered a service manual that should arrive within "6 to 10 days." I have a feeling that something is broken at the component level, because the problem appeared so suddenly. (I can't see how the adjustment could have changed by itself.) Have you performed this procedure yourself? Any help/advice you could give me would be appreciated.

Thanks,

They call it PIRATE RADIO because they hang Pirates when they catch them.
That is what the FCC will do if you are caught broadcasting music 5-10
miles on FM Radio without a license. Amateur radio regulations prohibitthe
broadcast of music. Other broadcast of music requires a commercial
broadcast license. You are facing fines ranging from $2000 to $15000 if
you are caught, which means free radio is only free until you are caught.
These are serious fines, the FCC does noto mess around with parking ticket
size penalties. If you choose to use amateur radio FM equipment, licensed
amateurs will quickly track you down and report you to the FCC. Tracking
illegal stations is an Amateur radio hobby/sport.

The IC-2GXAT does not have a lithium battery. It uses EEPROM. The EEPROM could be faulty, since it is a SMD device, you should return it to your dealer or ICOM for repair if the problem persists.

2302. Icom 706 Current Drain on 2 Met

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: Bill_Combs@mgdmug.ORG
Message-ID: <199608071246.01BA83C3@mgdmug.org>
Source record: 196279

I have been thinking of getting a brick amp for my 706 on 2 meters. I was thinking that I would have to buy a power supply for the amp, but then I remembered that the 706 only puts out 10 watts on 2, so the rig would not be drawing all that
much from its own power supply, and so maybe I could use the one supply for rig and amp on 2 meters. I have an Astron that is rated at 25 continuous and 35 ICS. However, I don't know for sure how much the 706 draws on 2 meters at 10 watts
out. In a review of the 706 in 73 magazine (February 1996), the author measured the current drain at 10 watts out on 6 meters at 8 amps. Of course that is still using the final output stage at reduced output. I am not sure what the 706 does
on 2 meters. I read one review that said the driver was fed directly to the antenna on 2 meters, but another review said that a different output transistor was used on 2. So I don't know if the 706 would use less than 8 amps on two meters
or not.

I wonder if anyone has the current figure for current drain on 2 meters at 10 watts out? I also wonder if I could use as big as an amp as the Mirage B-1016G, which is rated at 25 amps. I would think the 25 amps for the brick and 8 amps for
the rig would still fall within the 35 amp ICS rating of the Astron power supply. Of course, this would not work on FM.

Sorry I don't know all of the battery and charger voltages that you reference above, but you should be able to get by with a higher voltage wall charger on a lower voltage battery. For example, you could charge a 4.8 volt battery with a 7.2 volt wall charger, since the charger will be current limited to around 60 ma anyway, causing the voltage to drop to what it takes to charge the battery. I have done this. HOWEVER, the charger will get hotter and you could possibly have reliability problems with it, I don't know. Guess I wouldn't make a habit out of it.

Of course the reverse won't work, you can't charge a 7.2 volt battery with a 4.8 volt charger at all.

If it's simply a higher capacity 4.8 volt battery, say 1200 maH vs 600 maH, then you can use the same charger, but you'll have to charge it longer, perhaps doubling the normal charge time...

There is a 12 volt car adapter for the FT11/FT51 batteries. I know W & W makes one that plugs onto the battery, and Yaesu also makes one.

Apparently, it doesn't work well under Win95 either. At least, the
claims that simply uploading a "stock" template to a radio that has been
placed in "European" band plan mode do not bear up in a Win95
environment.

I haven't had time to verify that Win 3.1 is the key to the solution.
I'll report when I have results.

>Lee Mairs, KM4YY
>sagcorp@clark.net

About $200 would seem reasonable if the rig is in mint condition. Remember..
This is an old old rig for the Drake HF Tranciever series. It was the second
in the line... TR-3 TR-4 TR-4C then TR-4CW (Two versions). The TR-4 was the
change over fron the 12JB6 finals to the 6JB6 finals. It would make a really
neat collectors' item.

>take out some heterodynes on 40m SSB ... or ... can it take out
>SSTV signals, too ... pray tell?

Below is a review of the unit I posted on the amsat-bb mailing list a
couple of weeks ago. It's oriented towards satellite operation, but I
think you'll find it useful.

The heterodyne reduction has to be turned off in CW mode or CW wouldn't
pass, I would think. Het reduction is on all the time in the SSB/NR
modes, so I suspect the unit would reject or at least severly mangle SSTV
tones.

So if the RS DSP's wider CW bandwidths will pass SSTV tones, it will work.
If it cuts them out, it won't. The cutoff frequencies for each mode is
listed in an appendix at the back of the manual. I suggest you write down
your SSTV tone frequencies, bring this to the Radio Shack and compare it
with the manual. Sorry, I'm at work and don't have the manual handy.

To which Peter Klein replied:

I picked one up a Radio Shack DSP for $29 the other night. After working
with it, I can confirm Kevin's observations.

It has three bandwidths: Low, Medium and High. These are available in
each of three modes: CW, SSB and NR. The latter is *called* "noise
reduction", but it's really just another set of bandwidths. The unit

actually has no "noise reduction" within the passband, as Kevin noted.

In SSB mode, each successively narrower bandwidth narrows from both the top *and* bottom. In the narrow position the lower cutoff is about 800 Hz--not very intelligible, but it might save you from SSB "growler" QRM in a pinch. In NR mode, the lower cutoff is fixed at about 200 Hz, and the upper cutoff varies from about 3000 Hz to 2000 Hz. Because of this, I find the narrow NR position more useful than the narrow SSB position. Basically, both SSB and NR provide you with five or six useful passbands you can tailor to an individual's voice for best intelligibility.

Heterodyne reduction works well, knocking down any tones a fraction of a second after they appear. It is always on in both SSB and NR modes, so forget about listening to music on shortwave with the unit.

In CW, the bandwidths are about 1 kHz, 600 Hz, and 300 Hz. The narrow position is great for listening to a very weak signal. The filters have *very* sharp skirts. The only audible difference between the Radio Shack unit and my Timewave DSP-59+ at a similar setting is that the RS unit has a slight "blow-by" effect above the cutoff frequency. But all in all, the RS unit is a great aid to a CW op, and a great deal cheaper than buying a $90-$150+ xtal filter for a rig that doesn't have a CW filter. Since superstrong signals next to very weak ones are not the usual problem in satellite work, it should work about as well.

The unit has a built-in speaker (about 4 inches). It's a little tinny, but it works. I had no trouble driving my station speaker (a 5-incher salvaged from an old record player). The headphone jack is 1/4-inch mono. My Radio Shack mono headphones (the ones that are on sale for about $20 every few months) presented a slight mismatch, because I couldn't get enough volume to drive them. Note that many radios and outboard DSP units now accept stereo headphones, but on the RS unit, you'll only get audio to one ear with stereo phones.

The unit comes with a mobile mounting bracket. In fact, its target market may have been mobile hams and CBers.

Is it worth getting? If you don't have a better DSP, yes, especially if you operate much CW. But its lack of any real noise reduction limits its usefulness on satellite "out of the box." I always use my Timewave DSP 59+ on satellite in noise reduction mode. It makes the noise levels *much* more bearable on AO-10 and 13, on both phone and CW. I also use a narrow CW setting on AO-10 and 13 for weak signals. The Radio Shack DSP can do the latter almost as well, but [narrow bandwidth is] not really viable with LEOs or near-perigee passes of the high-orbit birds without fully automatic doppler compensation.

Perhaps some of our digitally dexterous folks could work up a *real* noise reduction algorithm or two for the Radio Shack DSP--something specifically geared to the kind of noise and signal/noise ratio we typically encounter on high orbit satellites. *That* would make this unit a cheap but viable alternative to the more expensive DSP units.

2308. RF Concepts vs Mirage Amplifiers

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: "Joseph M. Zawodny" <J.M.Zawodny@larc.nasa.gov>
Message-ID: <3208EE15.3C4D@larc.nasa.gov>
Source record: 196285

Hello,

I am getting ready to purchase some amps (6m, 2m, & 70cm) and
I find that RFC and Mirage make similar models. For those out there
that may already have experience, I'd like to hear what you do (don't)
like about these. I am also planning to mount them at the tower so I
also need details on whether these amps have a remote head and what
the cabling requirements are (they'll be 200' from the shack!).

TIA,

KO4LW

#I dunno, a forsale newsgroup seems highly appropriate.

It's somewhat appropriate, except for the fact that it's a somewhat
specialized piece of equipment, so posting to the rec.radio.forsale group,
or whatever equivalent there is, would probably be a better choice, to avoid
four thousand questions. I'm not a ham, but am studying for the exam, so know
what the 2m descriptor means (it's the wavelenght the radio transmits/receives
in)... Oh, for point of reference, in the US, you need a Ham license before
you can legally broadcast in the 2m range...

Well, it is that time again! It is Hamfest Season, and it is time
for he annual Duke City Hamfest! Here is all the information:

WHEN: Saturday, August 17th - Sunday, August 18th
TIMES: 8:00 AM-5:00 PM (Saturday), 8:00 AM-2:00 PM (Sunday)
WHERE: National Guard Armory, 601 Wyoming NE, Albuquerque, NM

* * FEATURES * *

* VE Testing (Saturday at 1:00 PM) * Outdoor Tailgate Swapfest
* Hourly Door Prizes * Grand Prize Drawings
* Search & Rescue Forum * Contests
* On-Site T-Hunt * ARRL Forum
* MARS Forum * AMSAT Forum
* RV Parking (Sorry, no hook-ups)
* PACKET FORUM - Information, plus the start of NM's Packet Users
Group!!!

TALK-IN FREQUENCY: 147.15 (+ No PL) Repeater

* * PRIZES * *

Grand Prize: Yaesu FT-840 HF Rig with power supply
Second Prize: Alinco DR-150 2 meter mobile
Third Prize: Alinco 2 meter HT

* * PRICES * *

Tables without Power: $10.00 each
Tables WITH Power: $15.00 each
RV Parking: $10.00 per Night
Raffle Tickets: $2 each, 3 for $5

See everybody there!!

2313. Modify T4XC to transmit CW with USB offset?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfDvs0oK.4EJ@netcom.com>
Source record: 196290

When the Drake T4XC is transmitting CW, it appears to do so through the LSB filter, so that transmitting carrier freq is shifted lower than the (supressed) carrier of SSB operation on the same freq. This is awkward for VHF/UHF work where USB and CW are the two modes of interest. Has anyone proposed or done a mod to the T4XC that has CW freq offset upwards?

73 Dave WB0GAZ dgf@netcom.com

Point your Web browser to:

www.iglou.com/copper

This is the Copper Electronics homepage. They sell the ChipSwitch product and have some info on it on-line.

The ChipSwitch is a replacement microprocessor for the HR-2510 and it allows the radio to tune over a wider range, and adds scanning and memory capabilities (and repeater offsets for 10 FM). This is not to say that the radio will be particularly happy OPERATING at the lower frequencies, but perhaps with some tuning you could cover both bands at a reduced power output or receive sensitivity.

I have no personal experience with the ChipSwitch, only what I have read and heard. I do own several HR-2510 radios and they have been very good performers for me, no complaints at all save one.

The unit I have in my car has a thermal problem (part of which is made worse by the mounting.... no airflow over the heatsink). When it gets REAL hot (from use or interior temperature of the car heatsoaking it) the microphone audio section stops working intermittantly (key up and talk and the MOD meter will show audio for a few seconds then will drop off to nothing, with no audio transmitted either). It only happens under the rarest of conditions, and is the only problem I have ever had.

I have talked mobile with a Larsen 10 meter mag-mount whip to the east coast from Oregon, and have talked to Japan from the Oregon Coast with this radio, and I am only getting started! For the money, it can't be beat for 10 meters!

If you have a Kantronics TNC and your looking for an interesting windows based host mode program, give KaWin a try.

Do watch out for one thing on the shareware version. If you check the host mode close option box under options/TNC's & Radio's, you may have problems running other programs such as PAKET 5.1. This box needs to be unchecked, else you won't be able to use your other packet software.

I made this mistake and rudely complained to the author who respectfully corrected the errors of my way.

I'm not connected with KaWIN

2321. FT-10 voice digitizer

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: Dennis Ward <wardd@lanecc.edu>
Message-ID: <32091970.484C@lanecc.edu>
Source record: 196298

I'm looking at buying the Yaesu FT-10 or FT-50. I'm wondering if anyone has used the voice digitizer option and what their experience has been with that option. I realize the voice digitizer option doesn't work correctly on the FT-50, but that wide band rx would be nice. So if the voice digitizer option doesn't seem any good, I'll probably get myself the FT-50. I'm curious to hear what other people have experienced or think on the subject.

2322. CTCSS Add on encoders

Source record: 196299

Greetings,

My trusty old Kenwood Tm-201B xcvrs do not have CTCSS encoders by
default (Kenwood had tu3 modules as an add-on option at one time).

Hamtronics makes a TD-3 and a new TD-5 encoder. Has anyone had
experience adding this type of circuit to transceivers?? I welcome
any feedback on your experiences. I would rather keep my current
transceivers, but if the circuit add-on is more trouble than it is
worth, I could probably upgrade to an HTX-212 or 242 for the vehicles.
Hamtronics has a catalog in the queue to my QTH.

Dan,

What about replacing the AM/FM antenna with a tape antenna on the windshield? Looks like a metal tape or paint on the glass, a fine line up the middle, and maybe across the top or bottom. Then put your ham antenna in the existing hole.

Maybe someone reading this group can suggest where to get a kit to convert the stereo antenna. Anyone?

Good Luck.

Look at the types of people who go into ham stores and the types of
people who buy radio equipment at truck stops. There is your answer!

2330. need help w/duplexer

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: John Gratton <johng@net.com>
Message-ID: <3208EED4.41C67EA6@net.com>
Source record: 196307
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I have an Icom 706 that I use on my sail boat. For the 2m antenna
I usually just use the Marine VHF masthead whip. It presents a
sufficient match and it's the highest antenna location available.

The problem is that I have to use an antenna switch between the
Marine VHF and the Icom. This may not seem like a big deal but
I would really hate to be in the position of having to call
'May Day' on the Marine VHF and remember to switch the coax switch.
Also it doesn't really look as nice as I'd like it to.

This got me to thinking about other ways of connecting both radios
to the antenna. One way I thought of was to use a powered switch
that would switch from one radio to the other when it was keyed.
It would have to be latching, so that the last radio to xmit would
also be the radio to receive. Has any one seen something like this
available commercially? If not can you suggest a set of components
that I could use to build one? It needs to be 12 volt powered
and as compact as possible.

Another option that I've been thinking would be a passive duplexer
that would provide one input for 144-148 Mhz and another input
for 156-165 Mhz (the marine VHF band). I've looked around
some catalogs and there are some products that come close.
Specifically, DCI has a band pass filter for 144-148 that has
-50 dB attenuation at 156 Mhz. This would be perfect if it weren't
for two things; 1) is huge (12x3x5) and 2) there isn't another one
made for 156-165 Mhz. It's a little higher power then I need too.
It can handle 200 Watts, I really only need 25 watt capacity.

My questions about passive duplexers are 1) Is a duplexer simply
a high pass filter whose out put is attached to the output of a
low pass filter? 2) Can one design a duplexer to give -45 to -50 dB
of attenuation between 148 and 156 Mhz that will fit in a 4x4x4
box? If the answer to 2 is yes, can someone suggest a design
or some books that I could read to come up with a design.

Any suggestions would be greatly appreciated.

Thanks,

johng KE6HUA

The hardest part for me has been to find a working COM port on the PC. My Gateway computer had two COM ports on the back - one was 9 pin and the other 25 pin. The 9 pin was disabled since I had a modem so I simply opened the case and swapped the cables between the two motherboard ports and it works fine now.

If only I could get my shack computer to work the same....

From: tsarah@gwis.com
Message-ID: <4u8fqo$3e4@gwis.com>
Source record: 196327

I have read a number of articles on this newsgroup and else where where some people don't like the belt clip that comes with the FT-50R batteries. So, I figured that I would put my 2 cents worth in.

I find that the belt clip on the FT-50R is not bad at all. The easiest way to remove it from your belt is to rotate it a little as you pull up. Works good for me. I have used belt clips for a Motorola Visar and a Motorola pager, and I'll take the FT-50R's belt clip any day over those two. I have had a pager drop off my belt when it's "plastic" spring broke and have had the Visar slip out of it's slide holster and bounce on the ground. Nuff said.

What version of Windows are you running it under? There was a thread
in which when ADMS-1C was run under WindowsNT it would not work
properly. But, under Windows 3.1 it worked fine. With Windows95, who
knows?????

Mine runs fine at least at this time. Hope the above helps.

You guys are forgetting that the HTX-212 has an extremely easy mod to be able to xmit from 143.00 - 149.00.
Just hold down F+DTMF while you turn on the radio.
You don't even have to open up the radio, or do any soldering. What can be easier?

Read page 17-18 in your manual.

Hi Sandy,

I have tried the RS DSP and have to agree that its value on voice is very low. However for $30 they would be a bargain CW filter. It is capable of very narrow audio bandwidth and helps isolate adjacent signals. If you want voice DSP look somewhere else. Hope this helps.

>newbyd@omniview.com

Dan,

Check with a local 2-way shop. Antenna Specilists makes a "disguise"
antenna that replaces the AM/FM antenna on most vehicles. It also
includes the duplexer you mentioned. This si one option, although a
poor one. About the best thing you can say about this type of antenna
is that it is an antenna. Performance is somewhat below a 1/4 wave
groundplane.

I would fashion a bracket that would fit behind the rear seat (?) and
come out under the rag top in the center. (I'm trying to visualize as
I had a 69 Vette many years ago.) I would use 1/8" cold rolled bar
stock and paint it to match. The main problem would be sealing it up.
A "no-ground-plane" antenna from Antenna Specialists, of Maxrad could
then be used. Most of the no ground plane antennas are actually
vertical dipoles and work reasonably well.

Last option, and probably the best performance, would be to fashion a
bracket that would tie to a bumper mount bolt and come out from under
the vehicle. If done right, this could be easily removeable for
shows, yet allow you to use one of the longer "ball mount" type whips.
(I use a 5/8 wave Hustler colinear on my van, and love it. About 6.5
Db of gain!) Instead of a ball, I would use the 3/8" stud mount from

Radio Shack. It's small, easy to miss, without the whip.

Anyway, those are my ideas. (I repair & install 2 Way & Cellular for
a living.)

The best thing to do is throw the pk88 away or sell it and get a TNC with a Carrier Detect. You will find the pk88 performs very poorly and will soon get discouraged. Get a Kantronics or even an MFJ. You will be much happier.

Ramsey sells a nice little kit that will broacast stereo FM at the
legal limit for about 30 to 40 bucks. This won't reach the 5 to 10
mile mark you want, but will cover a block or two if you have good
antennas and choose a part of the band that is relitivly unused in
your area.

You could add an amplifier, but that would be illegal. There are
large fines if someone has been complaining, which the big boys will
do.

By "your own music", I assume you mean music that you and your friends
have written and performed. Anything else would be a copyright
infringement. I doubt you would have much trouble unless you started
selling advertising. (Then EVERYBODY would be on your butt!)

If you keep the power at or below the legal limit, you can probably do
just about anything you want. The signal won't get far enough to get
you in trouble.

You may have some problems with the Electronic dash if you have one I did, had to run grounding straps every 24" or so under my Blazer between the body and chassis. I am also fighting a problem with the Computer I stall the car when standing still on 15 meters other then that no other problems. The rig is a IC-706 with the IC-AH3 and whip Ant. the Car is a 1986 Blazer S-10 Taho Pkg. Had know problems with the previous radio a IC-735 with IC-AH2 and whip ant.

Good Luck

Truck stops are already selling the galaxy radios. they are sold as a 10 meter radio, but they come with directions (usually removed by the store) on how to move them down to the cb band. a couple models have AM/FM only, and barely (if at all) reach 29 mhz. they also have echo and one has a voice disciser built in.

Hi All!

Along with KE1BG, I am starting a new HF youth net. This net has been going for a few weeks now, and takes place on 3.970 Mhz every sunday night at 8:30 PM eastern time. This net is most definitely open to all hams!!! If you are around sunday evening, please check in! We are going to start having discussions on hot topics in ham radio. It should be a very interesting and informative net.

This net will be booming out to your QTH from the metro Boston area, Massachusetts. Right now I'm the NCS, so listen for me. Hopefully, Sunday night I will have a bunch of new antennas up for 80m, and a new amp in the near future, so I hope to have checkins from all over.

AGain, all hams are welcome to check in! This is a continuation of a successful local 2m youth net that has drawn a considerable crowd in the area. In the future, although it is as yet unconfirmed, we might be offering the net at different times on other frequencies as well, mainly to take advantage of emerging propagation.

Once more, it's the 75 Meter Youth net, every Sunday night, 8:30 PM atlantic time on 3.970 Mhz LSB.

Hope to see you all there!

73,
Adam Kern
N1TYF

I wouldn't say $1500 but maybe $1100... $600 for the radio W/2M and $200 per extra band and $100 for the Sat. module... You can get a 736 used for $1500 w/1 extra band and it can do 4 bands and the 430 covers up to 450.. The 726 is a good radio but it has it's limits... 73 Pete n2mci@mhv.net

Must Sell ASAP: (No reasonable offer refused):
(2) Uniden FPS910TS 900 trunked HT. 9 System, 9 group 'brick' radio (rather large, a tiny bit more than the BC1/200 HT). Comes with 1 brand new batteries, 2 older batteries, 2 rapid chargers (not available anymore, hard to come by!!!) and 2 vinyl holster (no belt loop, just more for shipping/travel. $200/ each, or $375 for all 2. Invested much more into it. 2 currently programmed for TAC use.

(1) Johnson 9 channel 40?? (maybe 60) watt mobile. VHF. Was from Florida Sherriff or police which went to 800. Programmable by computer from Johnson Dealer. Must use external speaker (I can dig one out, standard 3.5mm plug), hand mike, and power cord included. GREAT radio. Scans, PL, everything. $250/bo.

(1)Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, Dual watch, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) (PLEASE don't ask how to do it, I was overrun by more questions on how to do it than offers to buy..)Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $280/BO.

WTB: Icom U-16, must be in good condition. Make offer, or trade for one of the above??

WTB: Yaesu VX-10.. Make offer, trade for ALL of the above?

All prices plus shipping + COD. I am NOT a company, just a collector of stuff I no longer need. <GRIN>

ALL PRICES NEGOT.! I need to sell, so give me an offer!

eplatt@wco.com, or call me anytime at 415-939-1037.

2369. FT23R Program, help?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: Dave Walker <Dave@Orolan.prestel.co.uk>
Message-ID: <3208D4B7.27FA@Orolan.prestel.co.uk>
Source record: 196354

I have recently been trying to re-programme a UHF FT23R set, I have worked out this is achieved, ie thru the mic socket after
putting it into programme mode using the "secret" switch, and performing a dump, ie as if cloning two sets, it seems to be a data
packet at 9600 baud, but when viewed on a scope it seems to have some extra long (4 millisecond) strobes in the message, and so i
cannot emulate this conventionally to perform a re-programme from my PC. Anyone know how it is done, Do Yaseu have a standard
programming system, is there a PC programme to do the job??

Any help or experience gratefully recieved,

Dave@Orolan.prestel.co.uk

I'm not sure about the 735 but on some of the other ICOM rigs of that era, they had some bandswitch problems. The IC-701 wat notorous for the band switch going out. BTW, there is no replacement. I have also seen problems with the band switching in the 751 but not to the extent as the 701. So that maybe a direction to look.

Sandy,

I picked one of those boxes up, and you are correct. They are useless
for noise reduction. They do a fair job with hetrodynes. They do
come with a schematic (tiny) and could be usefull to play with if
nothing else. The parts and the box are worth the 30 bucks.

I have been receiving weather satellites on 137.62 Mhz &
my dedicated receiver has been playing up. Usually narrow FM only gets
some
of the bandwidth, and wide FM gets too much noise on a scanner. I
haven't
tried this FT50 radio on it yet, but the bandwidth may be just right
for the weather sats & make it a lot more useful to me than listening to
broadcast FM would be- so I must hurry up & try it.

>slay@netcom.com

gee they figured it out...in the "old days", collins used a material control number (MCN) that was followed by a fiscal date (year, week, day..day 1 is saturday, day 7 is friday). today, assemblies get revision letters...

high MCN's would mean a late build. (go open up some gear..you'll see the MCN number stamped near the part number in most cases)

serial numbers are assigned in blocks. if there is an order for 500 of some thing, then 500 serial numbers are assigned to that product, but as the product works it's way through the factory, any number of things might cause any given unit of serial number x to be delayed or accelerated. it could fail testing. a problem could be found that affects only certain combinations of subassemblies (so unaffected products would pass on through...). whatever. it's possible a 2nd order could "lap" the troublesome products as a solution is found.

as a product came off the line, a configuration management record would be made that would show a serial number and the MCN of the major assemblies in the unit. this would be kept in case a service bulletin would be needed and then researched to find applicable serial numbers for the SB. for example if there was a receiver card that needed a SB applied to it only if it was made before MCN 71143 (roughly around the first week in january of 1971...), you could find out what units contained the older cards such that the service bulletin would spell out what equipment might need the SB based on serial numbers in turn based on the MCN of the assemblies it was built with..

however, the serial number only has meaning in a very general sense...and products are not always started at 1. in several cases, the SN also carries a "configuration" marker since it was picked from a block for a given product type. later, it's possible to reconstruct the history of a unit from this - especially important if the equipment is of a type that can be changed from one type number to another (say wide or narrow filters, with or without selcal, with or without constant audio output...) so if radio x shows up with y serial

number and service bulletin z, it can be determined that a given product was modified from one configuration to another...

2380. Anyone else using Alinco DJ-G1T?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-07 00:00:00 UTC
From: Yourname@somwhere.COM
Message-ID: <4ua69n$jtd@news.internetmci.com>
Source record: 196365

I purchased a Alinco DJ-G1T (HT) and it has been working really well around the house (with a good rubberduck antennna) and it has good features. I attached it to a 1/4 wave dual band mag-mount on the trunk of my car and when I am mobile the receive/transmit is really bad.

I am a new ham so I am wondering if this is just the nature of mobile communications or do I need to buy a 5/8 wave antenna and a 2m amp?

Steve

What difference could it possibly make? Anyone can walk into an amateur
radio store and buy any ham rig they want without a license. I know, I
used to work part time at a ham store in Delaware. We refused no one.

Pardon the reply to Bob's reply, but the basic post hasn't made it here yet. :)

Note also that the RS GRMS sets cannot operate through a repeater, as they have no setting which allows offseting the TX as would be required (In these sets, the TX and RX are set to the same frequency), nor do they have provision for sub-audible tone coding.

I recently got a used Kenwood TM-732A, but it did not come with the manual. Looking at a friend's TM-741A book, I was able to figure out quite a bit. But, I know the 732A can do UxU and VxV (in other words, listen to two freqs in the same band at the same time), but I can't figure out how to do it. There's no mention of it in the 741A book. Anybody know how it's done? If so, please reply via email. Thanks!

Michael, KB1UM

Jeff I would stay away from the higher powered units , mainly because the
higher the rp output, the faster the batteries get eaten up.

I would strongly recommend that you build a J-pole antenna from 300 ohm TV
antenna "twin lead". This antenna would be light weight and afford a lot of
gain over the rubber duck. You could coil up the J-pole and a short piece
of RG-8X feedline into the backpack and with some string or twine hang the ant
in a tree while camping or taking breaks.

If you need plans for the J-pole reply to me via email :

Well I think that you have the right to monitor these frequencies but
there are others that share them and I wonder what your intentions are
. So,therefore I suggest that you spend copious amounts of money to
buy the equipment necessary to find the frequencies. Have you
considered that you now become a suspect if ther is malicious mischief
in your area?

I believe the ROUND units were made AFTER North American Rockwell
acquired Collins Radio. Many of the KWM-2A, 30L-1, and 312-B4
units I got through MARS are the same internally even though
some are winged and some are round.

The earlier winged units did have significance in their
serial numbers, but later (particularly round emblem units)
ones have no relationship as you say.

2401. IC-3210/IC-3220 and similar x-band repeat

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-08 00:00:00 UTC
From: JohnWoolne@auslig.GOV.AU
Message-ID: <320A185F@mailgate>
Source record: 196139

Hi all,

This will work on the IC-3220 and I believe other similar ICOM mobiles.

1. Set up the frequencies you wish to use on each band - they may have
repeater offsets, but I'm not sure about CCTSS rules.

2. Press the BAND and SET buttons together for a couple of seconds - did
you notice that these are the two blue buttons? You will get a
flashing 'L' in the lower right corner.

3. Repeat step 2. to get out of cross band. Power Off/On won't do it.

PS no physical mods are necessary.

73's

John

If you want it programmed to conventional channels, I can do it for you at a cost of $25 plus shipping. Otherwise, to do it yourself, the other reponses are correct.

A "T54" radio?? All this indicates is you have a trunk mounted UHF mobile. Is it a Motrac?, a Mocom 70?, a Micor, a Spectra???? The 1056 test set can be used with many radios, and yes there are various cables for it to suit various radios!

Purchased one and played with it for all of one-hour. Found it to be
quite effective in removing heterodynes. Can't comment on noise or SSTV
reduction.

I can't use it because I operate strictly digi modes. Overall, seems to
well worth the $30 asking price *if* you intend to use it on the voice
of cw modes.

Source record: 196156

John this spring I ordered the TT on their 30 day trial. I received it w/o the latest software mod. and the frequency on every band was out of spec.

What I found was as follows:

- It has birdies that can't be covered up when the antenna is connected.

- The speech processor didn't make any difference when it was in or out. (yes it was adjusted correctly!)

- It requires an external power supply rated at 23A. The built-in speaker in my TT supply was "tinny". I had to use my Drake MS-4 speaker. That was part of the reason I bought the matching supply. Its receive audio at best doesn't sound "good" to me. Especially a YL voice.

- Both the Mic gain and AF audio only needed to be raised to the 8:00 to 9:00 o'clock position to be adequate. From 9:00 o'clock on was a waste.

- The attenuator is not separate from the preamp. This may not be a big deal, but I prefer it.

- The S-meter indication is S9 is at 2/3 full scale. Most all other transceivers S9 is at 1/2 full scale. What this means is if you operate on 80/160 meters, a noisy band will be pegging the meter. Also, on other bands with strong signals the meter will bang the peg because of needle inertia.

IMO the OMNI VIs good features:

- Its menu, knobs and silkscreening were very user friendly and easy to get use to.

- Its sensitivity on 10/15/20 meters is good.

- Its DSP autonotch is quicker and has less distortion IMO than the FT-1000MP

- The threshold NB on my local noise was good.

- I felt I could hear weak signals fine 160 thru 10m.

- The transceiver will not shut down at 2:1 vswr; it will put out full power at 3:1 vswr and not have the lockup delay of a rig with a autotuner.

I sent it back ordered a FT-1000MP. Some of the knobs are too small on the MP and it has taken me longer to learn to use it. But I'd not swap the MP for the TT for the reasons listed above.

73 "Picky Dicky"

Dick Sander, K5QY - These opinions are my own, not those of my company.

There's no reason I can think of that the old Heathkit QF-1 wouldn't work; it's just not as "sanitary" an installation as that afforded by the Waters built in unit. The QF-1 has a flexibility advantage (selectable null, peak, etc) over the Waters, however. Waters manufactured a lot of nice accessories for the Collins line; unfortunately one of their competitors virtually 'stole' some of their ideas and began marketing ersatz products.

<snip>
: take out some heterodynes on 40m SSB ... or ... can it take out
: SSTV signals, too ... pray tell?

It does take out a lot of the hetrodyne's, pops and hisses and makes
things generally easier to listen too. CW is where it really shines, what
it boils down to is a bandpass filter adjustable from about 400Hz to
2800Hz wide in various steps. Plus you end up with a fairly peppy
amplified speaker for those weak scanners and HT's if you bypass the DSP.

I got my for $34.95 (plus tax and gratuity:) and yes it was worth it.

Did anyone see the article on "Beyond 2000" or one of those shows which showed new techno geek kids that were into any type of cool gagets?

In addition to an email address, phone,fax, and beeper, each kid has a frequency on his business card!

They had four number calls like "4072" and appeared to be using ham and commercial HT's. They also used PK-88's
for data transmission.

Anyone see this?

My frequency is 165.2375 Mhz :-) just kidding.

73 de tom

p.s. they also QRM'd the Pope's cordless mic for fun.

From: vika@cdsnet.net
Message-ID: <4udpo6$7v6@news.cdsnet.net>
Source record: 196178

I have for trade a mint, like new, Yaesu FT-890AT all HF band transceiver. This is a compact radio with 100 kHz to 30 mHz general coverage receiver with 32 memories, noise blanker, notch filter, IF shift, built in electronic keyer, speach processor, and the standard 100 watts input power. Operates AM, SSB, FM, and CW. It is equipped with the factory installed internal automatic antenna tuner. I am the original owner of this, almost unused, 1992 model digital transceiver. I am a non-smnoker, and have never operated this radio mobile. It comes with the original box, manual, and hand-held scanner controlling microphone. In my opinion, this is a better radio that the current equivalent Yaesu model. You could not find a more mint example of this radio.

I will trade all or part for a Japan Radio NRD-535 receiver (sorry, no other trades are possible) or sell for $950.

Regards, John Pierce, KF7Z

What 2M mobile out there has good aircraft rec?

I know Azden does, but of the big guys, which rig is
acceptable.

I have a 229H and had a TM-241, and they were both bad.
But my Kenwood HT has good air rec, just like one would
expect from a scanner (it is a TH-27).

Any reports? How about the Icom 2000?

Source record: 196186

Which one's better, the HTX-202 or the IC-2AT? Hmmm...

If I had the chance to buy one or the other for the same price, I'd choose the HTX-202. I currently own an IC-2AT (not my first one), and I have also owned more than one HTX-202. They both use the same accessories (such as battery packs and spkr/mic). Both have good receivers, although I think the HTX-202 has the edge in intermod rejection. The IC-2AT produces louder audio, but I think the '202 has better sounding audio. The '202 is not as simple to use as the '2AT, but the '202 offers some very important modern features that the '2AT doesn't. One of these is CTCSS encode capability to access repeaters that are tone controlled. Yeah, I know you can add CTCSS to an IC-2AT (I just added it to mine three weeks ago using one of the tiny Comm-Spec boards and a 6-place DIP switch). The mod took me HOURS and HOURS to complete, and cost about $30 total. Just on that feature alone, the HTX-202 would have been cheaper by $30 and saved me trouble. With its memories, LCD display, ability to use readily-available Icom accessories, higher power output, and ability to run directly off of 13.8 VDC (the IC-2AT requires an adaptor, yet another expense), the HTX-202 is the clear winner, in my book.

BTW: I bought this particular IC-2AT recently, and it was C-H-E-A-P ($75 for the HT, two batteries, DC adaptor, drop-in charger, leather carrying case, extra antenna). Couldn't pass it up for that price.

FWIW...

2449. IC-706 Comments

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-08 00:00:00 UTC
From: Barry Williams <tticon@wt.net>
Message-ID: <320A9EC0.7A53@wt.net>
Source record: 196187

Hello All,

A few notes and questions on the IC-706.

I am using a CMOS SuperKeyer II which has the ability to adjust weighting, or to compensate for shortened elements by adding a fixed period to each element. Monitoring with a separate receiver indicates that adding about 12 to 16 milliseconds to each element seems to correct the weighting on the received signal from 10 to 25 wpm (my limit, not the equipment's) better than adjusting the keyer weighting. The only problem with this is that the monitor sidetone from the 706 now seems too heavy. There is also an annoying thump at the beginning of each element. Has anyone got a fix for this?

The serial number of this unit is in the mid 8000's, and when comparing it to the review in QST, I noted that the cw sidetone is adjustable in 10hz. steps instead of the 100hz. steps indicated by QST. Also, in the cw mode the IF is offset enough that you cannot hear the signal on the other side of zero beat as QST indicated, but in the cw-r mode the IF is not offset so that you can hear the signal both side of zero beat. Of course this is only in the wide mode. Did ICOM change the software between s.n. 2000 and current production, or did QST make a few errors?

In general, this is a charming radio, it does not compare in performance with the IC-781 or the FT-1000D I have owned in the past, but I think I will use it a lot more.

tnx es 73

>
The mod is in the book but it is under the MARS/CAP modification section
ran into same prob with exact same freq when radio first came out ...almost
returned it to R/S...cuz a radio that couldn't get the "LEGAL" band freq
I used I didn't want....but that 2 button "mod" saved the sale :>

Now if only RS would allow their repair centers to do the mod to the 212 to
allow it to have HTX-242 specs...ie extra channels....I hear it is a simple
programming change to the radio done thru the mic cord.

Just purchased a new 96 Lumina and need to switch my radio over to the new car. Also want to pick up a new dual band ant for the car.

Any suggestions on new antenna and hookups to the battery. Was looking for a way to route the power thru firewall but didnt see any openings. Also best way to route coax in from rear.

My old car was easy but it looks like it will be more work on this car.

> on what this might be would be appreciated, also email replies would
> be greatly appreciated.

Robbin, The owner's manual gives about three pages of info
about problem solving...it would be best if you could find someone
locally to see pages 34 - 36

The info includes a couple of reset methods to clear lockups...

Here is the method to restore all factory defaults:

Hold the D/MR and the REV/SKIP buttons down while turning on
the transceiver. Then turn the unit off, and then hold only the
D/MR button down while turning it back on again. This will wipe out
all your memory and other settings.

If this fails, there is also an internal hard reset availble...see
the manual.

And finally, there is an internal lithium battery which retains
all settings and memories while power is off...this battery may
need replacement. It is on the inside of the front panel, just
behind the memory box on the display.

Good Luck,
Bill, N0LAJ

The power adjustment is via the mic gain, this is mentioned in the
manual, this rig has a "rf" type .. this is how they work, your rig is
not faulty.

2464. Ranger 2950 tech problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-08 00:00:00 UTC
From: <>
Message-ID: <2f6_9608081441@pandabbs.com>
Source record: 196202

I bought a used Ranger 2950 mobil radio and the guy who sold it to me
thought it was cool to have the radio talk on 2 channels either way.
If your on channel 20, you can be heard on 21 and 19 as if you were on
the same channel.

I was told he had the bandwidth opened up.

Is the a coil, pot that can be turned to get it back on frequency?

Thank you

2466. My only FT50R complaint so far..

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-09 00:00:00 UTC
From: tsarah@gwis.com
Message-ID: <4udm5u$5bd@gwis.com>
Source record: 196204

Well I finally ran into something to complain about with the FT50R.
It appears that the barrety low indicator comes on only 3 to 4 minutes
prior to there not being enough power to run the radio. At least this
holds true with the FNB-41 battery. Not fun if you don't have a
second battery. But, if it's the only complaint I have with this
great little radio, then I'm HAPPY!

chavis@mail.dec.com (Ira L. Chavis) wrote:

>Im curious the major differences (besides $$$) between the Yaesu FT50 and the
>FT51 and why you may prefer either radio over the other

Probably the most obvious difference (and the reason for the cost difference) is the dual receive capability of the FT-51. Two separate receiver sections allows simultaneous V/U, V/V, or U/U operation. You can also transmit on one band WHILE receiving on the other, permitting full duplex or cross-band operation. The FT-50 receives one frequency at a time only, although it can "priority monitor" another.

There are a number of other differences in specs, etc. The thing I like best about the FT-51 is the alpha-numeric capability. It is possible to give alpha names (8 chars I think) to memories instead of channel numbers. The display shows the frequency and the alpha name at the same time. On the FT-50, alpha names are limited to 4 chars and this takes the place of the frequency display. (Not useful to me.)

I have both radios and like them for different reasons. If I could only keep one, though, it would be the FT-51. Hope this helps.

regards, Don (KE4KYO)

I am looking for a good radio to use with my AEA DSP 232 terminal node controller. I was thinking of buying either an IC-706 or a Kenwood ts-690. The reason I have chosen these radios is the fact that they both cover 6m. Will these radios work in pretty much all modes such as packet, navtex, rtty and others without any limitiations. I had also considered the ic-736 but it does not support rtty mode. Anyone have any opinions on these radios for what I want to use them for? 73's

Steve Zerbe <sazerb@rmii.com> wrote:

>Header says it..

Hope you have better luck than I did in getting a manual. The HW24HT is not the same as the HW24 although many people seem to think they are. There is some info in the Radio/Tech Modifications Edition 8B available from artsci 818-843-4080 for $20.

I can provide the keyboard sequence for out-of-band receive and transmit. If interested, DON'T REPLY to this id. Instead, send email to 72236.154@compuserve.com. My HW24HT died before I got to use it much (seems to be a bad crystal oscillator feeding the CPU) but since it only cost me $20 there won't be a big investment in repairing it). I may still have the info for programming the scan function.

There's no mod to allow storage of non-amateur frequencies -- unless you call buying the HTX-242 a mod! This is the new version of the 212; it's generally the same, with just a few minor updates (the ability to store non-amateur frequencies, for example). How to tell which is which in the dark? The backlight of the 212 is green -- the 242 is amber.

Ten years ago or so, I bought a set of "quadraphonic" headphones
on a close-out from a surplus electronics catalog. I don't know how
much they would have cost originally, but they were pretty cheap as
a close-out.

Anyway, it was my intent to wire them for four (4) different inputs.
But, as so often happens, I never got around to the project. They
are around here somewhere, and perhaps someday I *will*!?! :-)

Seriously (more or less), one pretty easy way to keep up with
three audio sources is to split the inputs to a pair of "open air"
(walk-man) type headphones. That gives you two inputs, and you can
still listen to a third source in the background via a loudspeaker.
I've done it.

Hey, life is short... I believe in "multi-tasking". :-)

Have an FT10 and FT40, used FT10 less than 1 hour since purchased at Dayton. I like the audio on both radios, features are great, out of band mod works great, and DPL works even better. I bought the FT10 because I bought the FT40 before Yaesu introduced the FT50, so I "needed" a VHF radio to go with the UHF. If your interested in Ham radio only, not stereo reception of FM stations, the price difference between an FT10 and a FT50 is something to look at very carefully.

Robert,

It may sound fun (when I was in college, we tried to do the same thing, but were unsuccessful, luckily.) If you do succeed, you WILL most likely be caught, unless you are in an area with almost no radio stations. As an assistant engineer at an FM station with several translators, we regularly monitor the band with a spectrum analyzer and would most likely find a 'pirate' station within a few days of it's debut. I'm sure you've read the posts from others outlining the fines.

Radio is an appealing hobby. I'm sure your intent is not to break the law. Why not go about it through the existing channels? If your desire is to communicate, try amateur radio, it's lots of fun! If your goal is to get your music 'on the air', seek out a local college or technical school radio station. I'm involved in both amateur radio and broadcast radio, a rewarding hobby and career. Good luck!

OK to get VHF in both: press lower BAND SEL key (bottom volume knob),
press the F key, then press the C.SEL key within 10 seconds. V2 lights in
the display and the bottom display also shows the second VHF band freq.
C. SEL is th pushbutton next to the display where it says VOL.

To get UHF in both press the upper BAND SEL key and follow the rest of the
steps. To return to normal press the F key and then the C.SEL key within
10 seconds.

> Thank you
> Dave

1) Dealing only with RESISTIVE loads: SWR = Rl/Rs for Rl > Rs, and
SWR = Rs/Rl for Rl < Rs. Having stated that, an SWR of 3:1 would
require a resistor of either 150-ohms or 16.667-ohms. SWR of 2:1
requires either 100-ohms or 25-ohms . . . . There are good
non-inductive carborundum resistors available for HF (be a little careful
with VHF or UHF). Generally, Peter Dahl (of transformer fame) in El
Paso, Texas (ad can be found in about any ham publication or on-line)
has a limited and changable stock of these devices.

2) If you are unable to bet the set of non-inductive resistors needed:
Remember that the definition of rersonance is that the capacitive
reactance cancels the inductive reactance in a resonate circuit. If
the circuit Q is included in a series RLC circuit, most of the "Q"
appears in the lumped R. If you think a little about this, it
allows you to use an inductive resistor as a non-inductive - although
narrowvand - load by simply cancelling the (lumped) inductance in the
resistor with a lumped (and tunable) capacitance. All you have left is
the resistance with no reactance. Remember that this is only a
narrowband solution and must be retuned for each band. I have used this
technique quite successfully on 144 MHz and $#@ MHz with "garden variety"
(NOT wire wound) resistors.

3) How can you determine the inductance of your resistor choice: Use a
known capacitor (preferably a good RF type - silver mica, NPO,. . .
will do) and a grid dipper to determine the resonate frequency and
calculate the lumped inductance from that:
2
f = 25330/LC

f in MHz
L in uH
C in pf

You can find all this in any of a number of ARRL publications,
including the Handbook. By the way, the equation above comes from
the definition of resonance itself - set Xl = Xc and solve for f in the
desired units.

From: Robert <rcollins@edcen.ehhs.cmich.edu>
Message-ID: <4ufbm0$461@ramp2.tir.com>
Source record: 196234

hello all....

I have experienced a very strange occurrance with my IC-706 and am hoping that someone might be able to explain it.

I have been trying to eliminate a RFI/EMI in my IC-706 for a while now, I have tryed just about everythng to eliminate it. I have had some success and have reduced the noise, but it is still there. I have the radio mounted in my Toyota Truck.

The other night while driving, I happened to turn the Noise Blanker off on the radio, and guess what....the RFI/EMI noise just about disappeared. I confirmed this several times and have no explaination.....anybody have any ideas????

and yes, I know when the Noise Blanker is on and off and I have not confused that,,although this was so strange I rechecked it in the manual.

any comments will be appreciated....

> 73, Ed WX4S

Hello Ed,

It will probably work fine on 14mhz and above, but don't look for very good performance on 40 and 80 meters. Radiation resistance on these bands becomes very small for whips. Center and top loading the antenna with coil and capacity hat is needed to get good performance. ie bugcatcher antenna with hat.

The only thing important about the length of coax between the tuner and whip is that it be long enough to reach. :-) Losses due to VSWR on the coax are minimal at HF frequencies.

2500. FW: Transceiver Problems.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-09 00:00:00 UTC
From: wpaperman@msmail.his.tch.tmc.EDU
Message-ID: <199608091832.NAA18841@pan.bcm.tmc.edu>
Source record: 196238

From: Paperman, W. David

I have been following several threads regarding failures in various brands of tranceivers. I have seen some of the well meaning suggestions (non-flame type) offered as technical solutions. These range from excellent solid suggestions from apparently technically experienced Amateurs through shots-in-the-dark from people who did not have the slightest idea of the design or operating parameters of the particular rig in under discussion.

I have (and still do, though to a lessening degree, as I age; manual dexterity and visual acuity lessens) maintain my own equipment and in some specials cases, those of some of my friends and offshore amateurs who have difficulties getting in contact with service organizations. I have been doing maintenance on both professional and amateur levels for nearly 45 years.

IMHO: If you have a rig "in trouble" and need some assistance, CALL THE MANUFACTURER's SERVICE DEPARTMENT OR THEIR AUTHORIZED SERVICE AGENT. Modern equipment is highly sophisticated and requires diagnostic procedures designed for the specific make/model in which the malfunctions occur. The proliferation of custom devices, such as ASICs' doesn't make diagnostic tasks any easier. An "involved" manufacturer will have a collection of maintenance history data (submitted by dealers and other point of sales/service sources) that will show failure trends in a given device; sharing that information with the technically capable consumer will save many frustrating hours duplicating the troubleshooting required to solve a problem that has already been resolved.

Most of us are hobbyists. We derive much satisfaction and no financial return from our "toys". With the relatively high costs of acquisition of new equipment we plan on keeping our gear for quite a while.
There is not , for all practical purposes an electronic device that will operate forever without any failures. It's when the device fails that the interest of a manufacturer in the consumers of its' product becomes evident. IF (and I have encountered this problem more times than I care to discuss) the manufacturer declines service advice, manuals or components, and, due to a lack of manufacturer support we are forced to replace a piece of equipment, it's time to CHANGE BRANDS. In all fairness it must be understood that there are practical limits based on economic factors that determine the length of time a manufacturer can support a product. This is especially true of components manufactured specifically for a given model of a product line.

This "support factor" is the primary reason my friends call me an ICOM "fanatic". I have alway had excellent support from Icom, both officially and

unoffcially. Their service people have gone into "junk boxes" to dig out obsolete parts that I could be ship to a fellow amateur overseas, where service was not available and rig replacement was out of the question.

TO R A with a SICK ICOM 735. The problem is PROBABLY bad trimmer capacitor(s) in the PLL circuits. This has been chronic in many Icom models. The orginal parts are plastic and deteriorate over time. The new replacements are ceramic. Replacement is easy IF a) you have the service manual, b) you are fairly experienced working on somewhat dense PWB's and c) have a decent (read-stable with calibrated microvolt level output capability) signal generator and DMM, preferable wiht RF probe. BTW: When I first encountered this problem (with a DX friend's rig, an IC-751A- we diagnosed it via skeds on HF) I called ICOM service in Bellevue. The technician I spoke with at ICOM was very up-front about the problem and its' cure. I had parts in hand ready to ship to my friend within a couple of days. I have since replaced those caps. in my IC-735, my IC-740 (after all these years, still the "primary" tranceiver in my shack) and my IC-745 (2nd op position rig).

To the person who offered the suggestion of a defective mechanical bandswitch: The IC-735 uses electronic bandswitching.

Some educated guesses:

1. Replace the internal mike with something that's capable of picking up
lower audio frequencies.

2. Speak closer to the mike. (This works wonders!! :-)

3. Rig up an equalizer.

Very early in the production of the Collins S/Line and KWM-2 radios serial numbers were issued. After that, the identification numbers were purposefully issued in a manner that would make it difficult to tell which unit was the latest made.

If the serial number ends in the letter "J", that KWM-2A was made in Japan.

The early KMM-2's and 32S-1's had no crowbar switch to short the HV supply when the PA cover was removed.

Sometimes the metal parts (such as the chassis) were marked with configuration identifiers. This is a revision status of the part or assembly. CI 730802 means the revision date of the part was the second day of the eigth fiscal week of fiscal year 1973. The radio would have been made after that date.

>Anybody out there in cyberspace who can authoritarily
>confirm or debunk this matter?

It was my priviledge to service this equipment in 1974. Many changes were made to improve the equipment over the years, it is all fine gear.

Jim,

I have the HR 2600 with Chipswitch installed and it works great. From my manual the following features of Chipswitch:

30 Memory channels with temporary channel lockout and repeater offsets

Extended frequency coverage. With minor modification and tuning coverage can be extended to the 10 12 and 15 meter bands.

Programable Scan/Seek Functions

Programable channel up/down buttons

Programable transmitter time-out

Split frequency operation

Everything works great on my radio. I use it mobile. You can contacct Chipswitch at:

Chipswitch

I would agree with Ron that in an area that doesn't use a two frequency digital repeater it is certainly better to have a tnc that uses a Data Carrier Detect, this can be added to most TNC-2 clones. I've added them to older MFJ1270s, which is quite easy, and to a PacComm Micropower2, similar to a Tiny2. This was a bit trickier however it works very well. The kit to add this used to be avaiable from TAPR for a pretty good price. I'm sorry I don't have contact info handy. One might also be able to pickup a newer version of the TNC's operating firmware. If I can be of more help please post or better yet e-mail or packet me. 73 John VE6OTC

I'm thinking about installing my IC-706 in my 96 Ford F-150.
I like the idea of a whip and automatic tuner rather than
the multi-band mobile antennas I've seen.

Any pros and cons for a whip with tuner vs resonant whips?
How important is the length of cable between the tuner and
the whip?
Any other suggestions?

73, Ed WX4S

Jim- There was an outfit that sold a simple12 meter conversion
setup a few years ago and it worked pretty well. I think,
however, they are no longer around. It was actually a ham who
sourced some components and offered the kit with instructions.
If you look in a "73" issue vintage 1989/1990 you may find his
callsign and drop him a note. I toyed with the idea at the time
but never followed through. Then about a year ago, I happened
upon an HR2510 with that mod installed and picked it up for a
good price. It works like a charm! It covers 12/11/10 meters, a
full 4 MHz of band spread with a really simple modification. I
still use it and will keep it around for the next sunspot cycle
and stick it back in the car again. BTW, the ad was usually a
small display ad in the back of the magazine. He was very
responsive to my questions at the time. Good luck-its worth a
try. Chipswitch never came through on their promises to supply a
workable product and had all sorts of emissions problems because
they tried to expand the bandwidth to cover 15 meters as well.
So far as I know, their kit never expanded sucessfully past 11 meters.

The problem is that the FCC and big business have a virtual lock on all
RF spectrum. For example - to setup a small radio station is beyond the
fiscal abilities of most people and communities because the big guys
suck up spectrum. The perfect example of that is WDGE here in Providence
that broadcasts on both 99.7 and 100.3 which is a complete waste of
spectrum.

BTW - Christian Radio? Like there aren't enough churches and bible thumpers
around?

Tony (Who remembers that Christians are responsible for the best and
bloodiest of wars.)

Ed Ingraham wrote:
> Any pros and cons for a whip with tuner vs resonant whips?

Hi Ed, I use a whip (no coil) resonant on 17m with an SGC-230.
It is about one 'S' unit down from a bugcatcher on 40m and equal
or better than a bugcatcher on 10m-17m. Neglible difference on 20m.

> How important is the length of cable between the tuner and
> the whip?

IMO, Mount the autotuner outside (easy to do in a pickup) and make
the wire from the tuner to the whip part of the antenna. There
can be very high voltages at the tuner output. It is best not
to use coax at all. I use a piece of RG-8 without the braid.
The SGC-230 doesn't even have a coax output socket.

A lot of the commercial stuff is encrypted, so what looks like random characters is really what they're sending. They often use a shift other than the amateur standard of 170 Hz, so keep that in mind too.

Body handling: Binary attachment payload not displayed: ft50.JPG

Using the FM wide mode of my FT50 I got this picture from the NOAA14
weather satellite on 137.62MHz. Normally a handheld has too narrow
a bandwidth to get the full greyscale and wide FM on my scanner
gets too much noise however I thought these results were ok.

While the results aren't quite as good as my Dartcom dedicated
receiver, this makes the FM-w on my FT50 just about right for my use.

Picture attached.

>rob n4yhd

AM noise blankers tend to clip signals and make them richer in harmonic
signals. it is possiable the truck does not emit much noise and the noise
blanker being enabled was taking a noise free truck and clipping other signals
up ans down the band so it appeared you had lots of noise. try turning on and
off the noise blanker when tuned NEXT a few kHz away, to a real strong station
you will see what I am refering to.

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2
ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment,
recrystaling, etc. I will provide instructions for the conversion & a
copy of service manual.

Ready-To-Go Repeater $300.00 + $10.00 s&h Fleetcom II converted to
repeater use, crystaled to your freqs, tuned and aligned, simple
controler w/id. You still need to provide a duplexer, and antenna.
w/manual

These units are all pulled from service and tested & aligned on
468mhz.

I also have a limited number of service manuals for older commercial
equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr + parts (1/2 hr min, estimate if repair
will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

E-mail your needs to:
kproctor@ix.netcom.com

Hi Ed, it makes little difference matching from the cab of the truck,or at the base of the antenna. The loss thru 20' of good coax with a 3 or even 4:1 "mismatch " will be un-noticeable on a "S" meter,especially on 75 or 40 meters. The "trick" is to use an efficient tuner. We have tested this many times in lthe "real world". However, I personally use base impedance matching at the base of the antenna to "wring" out every last tenth of a db.
On the lower bands, it is much, much more efficient to resonant the antenna with a coil in the center or higher up. Maximum radiatiation takes place where maximum current takes place. Maximum current is between the base of the antenna and the coil. This is why bumper mounted whips (no loading coil) tuned at the base ("base loading:") do poorly on the lower bands. Most of the current takes place in the tuner with little going into the whip. The ground loss becomes more excessive. The SGC antenna system is a good example. On 75 meters it is around -10db compared to a good center loaded system. One would have to increase their transmitted power 10 times to make up for a 10db loss.
If you want to work 75 meters and up, the "screwdriver" systems are good compromise. If you are interested only in 20 thru 10 the base tuned 6, 7 or 8 foot whip is not bad.

Good Luck, Jesse, W6KKT

Hi Ed, If you develope very high voltages (high impedance) at the
tuner output when attempting to match the base of a 1/4 wave (or
less) mobile verticle (which is low impedance) know that you have a
design flaw and high loss.
Respectfully, Jesse, W6KKT

True for a 1/4 WL but not true for less (or more) than 1/4 WL
(assuming just a whip with no loading coil). It is certainly
not a design flaw if one is doing it on purpose by design.

N5AQM used my whip, resonant on 17m, with the SGC on 40m on
field day. He made contacts as fast as he could talk. The
voltage at the SGC output was high and the loss in the SGC
was about 4dB, about one 'S' unit. N5AQM could not have
made any more contacts than he did even if he had
been running my 40m resonant bugcatcher. It is a relatively
rare occurence when 4dB will make or break a skywave HF QSO.
QSB is very often worse than 4dB. I seen QSB at 6 'S' units.
In fact, N5AQM would have made fewer contacts had he taken
time out for me to switch antennas and coil taps.

However, the high voltages I was referring to occur when using
the whip, resonant on 17m, on 10m where it is 0.4 WL. On that
band, the losses in the autotuner are offset by the higher gain
of the antenna according to EZNEC and my ground-wave measurements.
The difference in ground-wave performance of the SGC plus whip
vs my bugcatcher on 17m-10m is not measurable on N5AQM's receiver
and it sure beats changing taps on a bugcatcher (at 75mph in
the rain. :-)

I don't have the TH-22 but but I have its 440 MHz twin, the TH-42. I love
it. Good operational features, great size, solid feel. I've had it over
two years and it has performed perfectly. The audio qulaity is good and
the output is sufficient for my normal use which is as an HT, *NOT* as a
substitute for a real mobile rig.

2552. Motorola UHF Syntor Conversion Info. Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-10 00:00:00 UTC
From: Brian Kline <kline@hybrid.com>
Message-ID: <320D1088.42F5@hybrid.com>
Source record: 196095

Hi

I am looking for information on converting a Motorola UHF SYNTOR mobile
to the 440 to 450 MHz range.

Looking at the manual it does not look to difficult.

1. Pad the VCO down so it tunes the ham band.

2. Decipher the synthesizer programming information
3. Decipher the PL encoder programming information

4. Program new PROMs

5. Retune the helical filters

The model I have is a T44SPA3J00BK. This radio appears to be a 450 to
470 MHz unit.

I checked the oakland.edu modification data base and did not find
any info. on the SYNTOR.

The information that I am most interested
in is programming information for the PROMs and how to modify the VCO.
The VCO in the unit that I have has all of the microstrip plates
that are used to fine tune the VCO range connected in strings.
Can I lower the range by snaking the path between the two groups
of microstrip plates?

Current VCO microstrip plate connection

```
|-O-O-O-O-O-O-O
|
|-O-O-O-O-O-O-O-O-O
```

O = microstrip plate on the ceramic substrate

Proposed VCO microstrip plate connection to lower the frequency range

```
|-O O-O O-O O-O
| | | | | | | |
| O-O O-O O-O O-O-O
```

The SYNTOR manual indicates that the ceramic substrate is extremely fragile
and must be preheated to 150 F before soldering so I would like to avoid
to many trial and error experiments on this.

The Synthesizer PROM appears to be a Motorola MCM7620 or MCM7621 but it
should be possible for me to use any 512X4 bipolar PROM with the

same pinouts.

If some one has information on converting and programming this radio
please email me at kline@hybrid.com, so I can avoid reinventing the
details of this conversion.
I would also be interested in the same information for VHF HI, VHF-LO,
800 MHz SYNTOR and the SYNTOR X for future projects.

Thanks

> you that you need brake fluid.
> Is this kind of stuff normal?

Generally, yes. The output of the HTX212 meets FCC spec, but most consumer electronics are not well shielded - cordless phones are often one of the worst offenders. In my case, my '212 would completely reset my auto FM radio every time I transmited on high power. That particular radio was an RS model. The problem went away when I installed a Sony car FM... :-)

Have a good skip...

A thought on the whip/tuner vs. resonant whips.

I am running an Alinco DX-70 through the Alinco mobile ant. tuner with a Hustlet 80M resonator. Using this
set-up, I have no problem getting a 2:1 or less on the bands that I operate.

Just another thought...

I have absolutely no complaints about mine. As far as the audio quality goes, other listeners say it sound fine (not muffled and not overmodulated). The built in speaker is loud enough for handheld use, but I have been using this as my mobile radio as well, and I have to use an external speaker to hear over road noise. I don't really consider this Icom's fault, more mine for using the radio in ways it wasn't designed for.
One nice/wierd thing about the radio is that it will let you tune to any frequency from 10MHz to 999.990MHz . It doesn't really recieve directly outside of the VHF band, but you can hear images of some other bands, like the 450MHz band, that show up when you tune around 300MHz. Once I figured out how to tune in specific frequencies, it turned out to be sort of a bonus. However, I have not heard any unwanted signals (beside imtermod) in the intended 144-148MHz band.
Let me know if you buy one and I'll send you a formula you can use to tune in the 450MHz band.

2563. 2m mobile does funny things to electronics

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-10 00:00:00 UTC
From: hbcsc274@csun.edu
Message-ID: <4ugquf$qos@dewey.csun.edu>
Source record: 196266

I just got a Radio Shack HTX-212 2m mobile 10/45 watts.
I noticed it does some funny things to other electronic devices when I transmit on high power. For example, when I am parked in front of my drive way and transmit, mine and my neighbor's porch light turn on. These lights are the kind that turn on when someone walks in front of them. One of those security lights. So when I transmit, these lights turn on. My car and antenna is about 40 ft away from both of these lights.
Another time, the warning light for my brakes in my car lit up when I was transmitting. This is the warning light on the dash of the car to tell you that you need brake fluid.
Is this kind of stuff normal?

Subject: Re: article

Phillip,

Below is a text version of your article. Thanks for contributing
it to the Palmtop Paper.

Rich Hall

*** Article begins here ***

*Using the HP Palmtop
with a Ham Radio

This user connects his Palmtop
to other computer systems via a Ham Radio.

By Phillip Nichols

About the author: Phillip has been interested in computers since he purchased his first computer, a Commodore Vic-20. He spent his Junior year in High School as a teacher's assistant in his school's first computer class. Since then, he has used his personal, palmtop, and amateur radio skills to help others, spiritually and otherwise.

Recently my notebook PC took a trip to the doctor; maybe it was a vacation since it was gone for almost two months. My computing was done solely on my HP 200LX. It so happens that at about the same time I received my FCC license for Amateur (Ham) Radio. (I had the urge to try Ham Radio, studied from scratch, aced the test, and waited around for the license).

All right! My license came in (KC8DQF)! Now I could "boldly go where no-one has gone before...," or at least where I'd never gone. I immediately wondered if I could tie my Palmtop into the radio for wireless work. I read about something called "Packet-Radio" -- a way of connecting computer systems and networks by means of Ham radio. Then I saw an ad for a "packet modem" that plugs into a computer to convert it to a TNC. A "Terminal Node Controller" is what Ham operators connect to their radio for the digital/analog conversion of the computer data as well as for providing error

correction protocol called AX.25.

You need the right stuff

The packet modem was the BP modem by Tigertronics (1-800-8-BAYPAC). It comes with special communications software and the modem (a small 2-inch-square custom analog/digital modem based on the old Bell-202 standard). The BP draws 9ma of power directly from the serial port of the computer. No external power supply for the modem is needed with a standard PC. The general advice with a Palmtop is to use an AC adapter when connected to a modem. However, I find that the BP modem does not significantly reduce battery life and don't bother with the adapter.

The final piece of hardware in this setup is the actual radio transmitter/receiver (a RadioShack HTX-202 Transceiver). I prefer this radio because it does not allow Wide receive 108-174Mhz. What this means is that it is less bothered by what is called "Intermod" or interference from ghost signals "mixing" with Ham signals. This is important in choice of radios for this type of work. Now the question was: "Can I hook all this up to my HP Palmtop?"

Getting it all to work
with the Palmtop

Sure enough! I fiddled around and got it all to work, and then discovered that someone on the web has done the same thing with the exact same equipment (minus the antenna). So now there were at least two of us using the same Palmtop/packet radio combination. Now I could really send and receive "airmail." Although I use this system mostly at home from a desktop PC, the fact that it works with the Palmtop means that I can logon anywhere. Even from inside a shopping mall or at work.

I physically connect my Palmtop to my wireless transceiver using my packet modem. Previously I have loaded the necessary software drivers on the Palmtop so that it can communicate with the modem. I start the Packet radio communications software on my Palmtop and type "connect" followed by the call letters of the person I want to communicate with. It's that simple.

Each packet radio area will probably have many PBBS's (Packet Bulletin Board Systems) running a newer communications protocol known as JNOS. This protocol is similar to an Internet TCP/IP protocol in that it lets you communicate with packet radio addresses that are not in your immediate area.

Once you establish connection, you get a menu just like a normal BBS menu. There are up to 30 commands you can access, so there is a lot you can do depending on what BBS you connect to. As with Internet, Packet BBSs let you "telnet" (link) to other sites in neighboring counties or states. You can even send files by radio, although 1200 bps is a bit slow.

Another user's story

Jason Baack of Maine, the other person I mentioned that uses this setup, told me how he got started.

"I was first introduced to packet radio two years ago on Rainbow Lake in northern Maine (U.S.A.). The total permanent population for the area was listed as four, living in a township called 'T2R11.' There were no roads into the lake, (you had to fly). Three 1.5K generators provided power during the daylight hours, so I was able to use my ancient Packard Bell 286. I got my Ham operators license while I was up there, got a wave antenna and other necessary equipment, and had a blast the rest of the summer connecting to DX nodes, the far reaches of Canada, Nova Scotia, and talking 'keyboard-to-keyboard' to some local (20 miles away)."

Jason (call sign N1RWY) has plans to contact the Mir space station someday from a nearby mountain, while I, though no less adventurous, am stuck in the flatlands of Michigan. I am planning to operate a land-mobile packet station while I ride on vacation trips this summer and also would like to find a pilot at a nearby small airport willing to try a little air mobile to see how far I can QSO (Amateur Radio communication on the air) with another station.

As it is now I can hit a packet Bulletin Board Service near me and get mail, topical groups, and telnet to other stations that may otherwise be out of my power range. There is even a World Wide Web/IRC-style conferencing area called CONVers for communication with other "packeteers" around the United States. And finally there are Gateways that tap directly into the Internet to speed things up.

Amateur Radio:
A hobby that's fun and helpful

Amateur Radio operators and clubs perform services by providing communications in times of disaster (both natural and man-made) and sending messages from non-hams to people around the globe that they may have lost contact with! Ham operators seem very interested in helping both the ham and non-ham. One fellow ham gave me an old receiver to help me improve my Morse-code abilities so I could communicate over world-wide frequencies. He also gave me 26 back issues of QST, a relevant Amateur Radio magazine. Another Ham is going to help me improve my antenna.

[Note: QST is a publication of the Amateur Radio Relay League (ARRL). Call 1-800-326-3942 for information on becoming a Ham operator as well as joining ARRL. Membership includes the monthly QST magazine. They also have a NEW-HAM kit, which they'll give you free of charge (no membership required). It's their way of introducing you to their services and getting you started in ham radio. I also received an offer to receive a free Ham-related book.

I chose Hints and Kinks from the list of titles. It contained a lot of little fix-it tidbits good for new Hams to know before hand, like how to mount your first antenna on your car without destroying your car in the process.]

Amateur Radio Clubs also get together monthly and have special activities for both fun, as well as some that help emergency preparedness for the community. An example is the Amateur Radio SkyWarn system that tracks severe weather and reports it to local weather services. In Ontario, Canada; I have met some who chase and report on storms as well.

Amateur Radio provides you with the opportunity to experiment and challenge your own personal limits. In addition, it lets you give something back to your community. I definitely stretched my Palmtop's capabilities, but there's more room to grow. With my HP Palmtop I can run satellite tracking programs to locate Amateur radio relay satellites in "real time" using REAL95.ZIP <contact info at end of article>. I have another TSR program I run while on packet that can help locate and calculate the distance between myself and the ham on the other end (GRID.ZIP <contact info at end of article>). I have modified a Palmtop-database for keeping a log of my contacts (ARS-LOG.ZIP <contact info at end of article>).

You can investigate ham-related topics by contacting a SIMTEL site on the Internet. Most have an amateur-radio and packet directory listing topics of interest. One such SIMTEL site containing about 100 topical directories is:

http://oak.oakland.edu/simtel.net/msdos/index-msdos.html

Another non-SIMTEL, but more ham-specific site is:

http://www.cdrom.com/pub/hamradio/oak

The more I look, the more people I find using their Palmtop with radio. We hope to "QSO with you on 2meters (144-148Mhz)" sometime, or else exchange some packet e-mail! So how about getting your license? It's now easier than ever to get started, you don't even need to learn Morse-code to begin (but you'll earn more respect if you do). You have nothing to lose, and world of ham operators to gain.

For more information visit Jason's web site at:

http://www.umecut.maine.edu/~baack

or Ham-Radio On-line at:

http://www.accessone.com/~vbook/hronline.htm

Packet radio networks

Ham operators designed their own "Network" of computers back in the late 70s. The Canadian Department of Commerce legalized Packet Radio by ham operators in 1978. Then the TAPR '80 (Tucson Amateur Packet Radio corporation) began developing radio communication protocols. 1981 TAPR decided to use a version of the computer industries x.25 communications protocol, calling it AX.25 ("A" for amateur radio). Packet radio communications started with a few people who could afford computers and to modify Bell-202 modems with the TAPR chip protocol.

Soon computer prices fell and Terminal Node Controller kits were becoming more available. Radio networks were being set up much like a unix "on/off LAN" and businesses "constant-on LAN." An example of an "on/off LAN" is an Internet web browser, that is not actually connected to the web site all the time, but intermittently connects to ("pings") the web site for information. A computer bulletin board system like CompuServe is an example of a "constant-on LAN" because it is always connected to the net and to other nodes in its system.

Pricing and Contact Information for products mentioned in this article

All prices are manufacturer's suggested retail price. It may be possible to purchase the product for less at third-party vendors.

BP Modems
Model 2 -- $49.95
Model 2M -- $69.95

Hi Gary. In ref to using a Diplexer on the IC-706, would the same
protection be achieved by using only the VHF side of the diplexer
on the VHF input of the 706? That is, is it necessary to hook
the HF side of the rig to the diplexer (assuming one can find an
antenna to run both HF and VHF ?)

thanks,
Joe

2568. Icom IC-271A

Source record: 196021

I have found a near mint Icom IC-271A at what I think is a decent price and am looking for opinions on this rig. I would also like to ask a few questions.

Are there any mods for the radio?

How will it work with a TNC for packet?

Can it be used at 9600?

Any transmit or recieve mods that need to done to improve the performance?

What about accessories that I might pick up to enhance the performance?

Thanks in advance,

Lewis Stephens

2572. Help figure out mic pin-out for old Icom

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-11 00:00:00 UTC
From: Greg Corteville <cortevi5@pilot.msu.edu>
Message-ID: <320DF8B7.7D1D@pilot.msu.edu>
Source record: 196025

I was given an Icom IC-230 radio a few days ago. Its a 2 meter radio. It must be at least 15 years old, but supposedly it still works. Unfortunately the person who gave it to me didn't have a manual, microphone, or power cable. I did a splicing job and took care of the power problem. Now I'm trying to figure out the microphone. It appears to be a 4 pin CB style round plug.

```
o o
o o
^
```

The ^ indicates a notch in the connector. The connector is male on the radio. By shorting the two pins on the right I was able to get the radio to transmit (as confirmed with my frequency counter). So these two are obviously the PTT. The pins on the left, I assume, are somehow responsible for carrying the audio from the mic. However, I've found by testing with a multimeter that they are putting out 13.8V on these pins also. The pin on the lower left is + and the upper left is -.

So now my question is, can I find a readily made microphone to work with this thing? If not, what do I need to do to make a microphone for it from one of the newer 5 pin CB mics or some other cheap mic? What do I need to do to make a packet cable? I assume all of these questions revolve around isolating and getting rid of that 13.8V?

2573. Yaesu FT-8000R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-11 00:00:00 UTC
From: tsarah@gwis.com
Message-ID: <4ul66s$nb7@gwis.com>
Source record: 196026

Since this is such a new unit, I thought I would start a thread and see if anyone else has any comments on the FT8000R. I purchased mine last Firday (8/9) and have it up and running in the shack at this time. Haven't had it on the road yet, but will this Wednesday and we'll see what happens.

So far this has turned out to be a great unit. Everyone that has heard it say it has great audio. And, it appears that it also has great sensitivity on receive. One real nice feature, and this may exist on other units, is the ability to scan the whole band and store active frequencies in a special memory. That way when you visit a new area, you can scan and store the frequencies used there. And, yes there is programming software available for this rig just like the FT-50R, etc. Also, it's really nice to be able to scan the 140 band at the same time you scan the 440 band. You can be talking on one and still scan the other.

The only thing I have found so far that is a little annoying is that it has the ability to story only ONE 16 digit DTMF Autodiler number per channel. Any thing else has to be entered through the key pad on the microphone. And, you can't hear the tones being sent.

From: rclayton@csc.umd.edu
Message-ID: <4ulbom$u1g@hecate.umd.edu>
Source record: 196030

I have an ASDEN PCS 2000 which will only put out full power if I
use an antenna tuner and de-tune the antenna. I am using the LEDs
on the front to determine the output. I think that this means that
there is a crowbar circuit protecting the final amp. module which
is faulty. The problem I have is I am not sure which part of the
circuit this is. I don't understand SWR circuits all that well.
The PA module it uses has part no. TMS 1000 NLC on the schematic.
I was wondering if the SWR protection was internal to this module?
How should I go about tracking down this problem?
Thank's

Source record: 196031

I have a a 19 inch tv that has a problem with the picture...it is simply a horizontal line across the secreen. Also have a vcr that has a problem with the motor drive.

If anyone out there has any use for these items that would keep them out of a landfill (ie hopefully repair them for the fun of it or could use the parts) I'd be happy to give them away.

I am am the Portland, Oregon area. I am sure I can find someone that would like to use these, possibly a school with an electronics class, so if this notice is interpreted as a cheap way to get rid of my problems, please don't be offended.

If necessary I'll salvage them myself, but hope that someone out there could benefit from having them.

From: lewis@phoenix.net
Message-ID: <lewis-1108961443480001@news.phoenix.net>
Source record: 196032

I just bought a used 2 meter all-mode and wondered if any one had any opinions and mods for a Icom IC-271A. It seems like a nice little rig and fairlty sensitive. I can only compare it to my Icom 2350 and a radio shack rig for performance.

Can it be used for packet and what will I need? How about 9600?
Any recive or transmit options?

Any thoughts would be appreciated.

Thanks,

Lewis

2582. Need help Identifying Micor .mobile?. repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-11 00:00:00 UTC
From: sidener@saucer.cc.umr.edu
Message-ID: <4ullva$2m7@hptemp1.cc.umr.edu>
Source record: 196035

Hi, I just got hold of a Motorola Micor which I need help identifying.

It's model number is: Q2033A SN# 539CNW0006

It is a UHF (462 MHz) radio with 10 reciever channel elements.
There isn't any place for TX elements so I assume it derrives the TX freq
from the RX channel elements.

On the end of the radio there is n extension aout 5 inches long. In that
extension there is a duplexer! It is set up on a 5MHz split.

The radio has two RF connectors on top 1 UHF and 1 BNC.

The radio also has a tone board.

This looks like a perfect candidate for making a 440MHz repeater.

Can anyone give me more info on this radio? I have a VHF Micor mobile
manual and a 50MHz Micor repeater manual, but nothing I have comes close
to this. I need to find someone with a manual.

Also, why does it have two RF connectors at the top and can I use a
regular Micor control head with it?

Any help would be appreciated.

Thanks,

Scott Sidener

A local scout unit/school group wants to setup a fixed HF/VHF station, and a mobile HF/VHF station. They have received donations of VHF equipment (radios, antennas, meters, etc...) so the VHF side is well taken care of. They don't have much money for HF gear at this point. I'm posting this to get your varied opinion as to what kind (Make - Model) radio works/holds up best for these type groups. The group is seven strong now with two no-coders, three tech+s, and two generals. They have a radio class setup to start two weeks after school starts to hopefully gain 5 to 12 more members. They would love find a source for good used equipment.

Brian -

I have done a couple of these and here are some random comments :

1. I did not modifiy the ceramic substrate as you discussed. The power output dropped about 10-15% but otherwise the transmit tuned up ok. The transmitter is fairly broad banded and you can get about a 10mhz spread.

2. The receiver is much more narrow banded and will only split about 3-4 mhz at best.

3. I have a copy somewhere here of the programming scheme for the PL boards that use the plug in resistor networks. If I remember it takes about 8 100K resistors to do each tone. I have some SYS-90 Multi-PL heads if you might want to consider these as options.

4. If you have the programmable board, I can burn you a PROM for the board.

5. I can also burn you a frequency PROM for the TX/RX frequencies if needed. I have a "TUNE UP" PROM that I burned that stepped the frequencies from 460 down to 440 in 1 mhz steps and this allowed me to tune the TX preselectors very easily.

E-mail me if you need further info.

hi there, I have two radios for sale. One is a very dependable mot. motrac curently crystalled on 53.31 (-1mhz tx offset) for Mt. Wachusett in central MA(covers almost all of MA, central CT, and southern VT and NH, And 52.525 simplex. Aftermarket tone unit installed. I have the matching control head, mic, original speaker and complete wiring harness, all in very nice cosmetic cond.. Will ship for $100 or $80 pickup or delivered within 1 hr of Boston. The second radio is a midland ht, model 70-045-48a, low band low split 29-36 mhz. This is the full display, 99 ch, user programmable tone version AND it works on 10fm. I will program to your specs. The unit is in virtually perfect cosmetic condition (some very minor scratches on the bottom of the display) Electronicly mint. comes with a duck and hi cap. (1300 mAh) battery. I am asking $400 or best offer, cod overnight shipping included. Email me or call Will at 617-237-5928. 73, Will, N1PXA

Mike, I still have and use an FT-980. Not too long after I bought it,
I called Yaesu about modifying the radio for GC transmit. I was
advised by a tech that even though Yaesu sold a mod kit for the 980,
he strongly recommended NOT installing one. He told me that he saw
many 980s come into their shop with bad PAs and felt that the GC mod
was the culprit.
How right or wrong that tech was, I don't know. I never went ahead
with the mod. Maybe someone else had some experience with it, but I
thought I would pass that on to you FYI.

I forgot where it went, but do a search using LYCOS with
"standard c508 mods" and it will be about the second item that
pops up- some university at oakland... hold on

http://oak.oakland.edu:8080/pub/hamradio/mods/standard

found it. It involves removing back cover, unsolder one side of
battery & lever it up. Remove 2 chip 0 ohm resistors. They are
soooo small! I used a magnifying glass to see them.
end result gives tx 135-170 400-470 or there abouts
rx up near 480 was mediocre & actually received better at
2x freq -IF freq from memory. The mod page will say what chips to
remove. Neat radio isn't it- sooo tiny

cheers

Dan,

I dont have anything in writing, someone faxed me a diagram. All I can remember is that you remove the keypad by unscrewing the screw underneath the Nicad label on back of radio. Then, on the board under the keypad, main radio board, not keypad board, is a few very small chip 0 ohm resistors. One of them must be removed, and a radio reset performed. Can't help on which one.
Tom

Hmmmm... in another posting you said high voltage at the base
of a mobile antenna is a "design flaw". A "base tuned 6 ...
foot whip" used on "20 thru 10" is guaranteed to have high
voltage at its feedpoint. (I love to nitpick a nitpicker). :-)

Cecil, would you please give more information on the gain you say you
acieved by using a 17m resonant whip on 10 meters as opposed to a
regular 10 meter whip.?
1. How much gain over a 10m whip does the 17m loaded whip exhibit and
how did you measure this gain?
2. How did you measure the tuner loss when matcing a very
high impedance point (0.4wl)?

3. How and with what did you insulate the high impedance feed point from the vehicle.
4. How did you overcome the loss resistance of the reactance needed to resonant the whip on 17 meters when using it on 10 meters?

Cecil, if what you say is true you have come up with a revolutionary, new, lossless system. Congratulations!
Respectfully, Jesse, W6KKT

Hmmm....and, you picked up on that! You are absolutely correct. When
using short, non resonant, whips the reactive component will raise the
relatively low feed point impedance (sometime to very high values).
The ensueing dielectric loss due to proximity of the whip base to
vehicle, tuner losses, and additional ground loss ,will degrade gain
(if any) over an isotropic radiator.
I welcome a "nitpicker". I put myself at the top of the list as having
the ability to be incorrect.
I will challange anyone who makes rationalizations and justifications
why an antenna system need not work to the best of it's ability.
Usually, when challanged, these people use words like "nitpicker".

>1. How much gain over a 10m whip does the 17m loaded whip exhibit and
> how did you measure this gain?

I'm at home and my EZNEC file is at work so I can't give you the
exact EZNEC figure today. A 0.625 WL vertical has 3dB gain over
a 0.25 WL vertical. A 0.25 WL vertical on 17m is a 0.4 WL on 10m.
Therefore, a 0.25 WL vertical on 17m exhibits gain on 10m, a well
known fact because of the more narrow beamwidth.

>2. How did you measure the tuner loss when matcing a very
> high impedance point (0.4wl)?

I didn't measure it directly. N5AQM monitored my ground wave. We
compared a resonant whip, 0.25 WL on 10m, with the 13ft whip plus
the autotuner. The 13ft whip plus SGC was slightly stronger than
the 8.25ft whip indicating that whatever loss there was in the SGC,
the longer antenna was more than making up for it.

>3. How and with what did you insulate the high impedance feed point
> from the vehicle.

The SGC autotuner does that for me. It has a high-voltage insulated
output, not a coax connector. I mount the SGC on a piece of threaded
stock fastened to my bumper hitch hole. The wire from the SGC to the
whip is a piece of RG8 without the braid so it becomes part of the
antenna.

> 4. How did you overcome the loss resistance of the reactance needed
> to resonant the whip on 17 meters when using it on 10 meters?

Like I said, based on field-strength measurements, the loss in the SGC
is more than made up for by the gain in the longer antenna. I didn't
"overcome the loss resistance". Let me give you an analogy. A 10/8 WL
dipole is fed with coax. Even though there may be an extra 3dB loss
in the coax because of the SWR, the 10/8 WL dipole will still perform
just as well as a 1/2 WL dipole in the directions of maximum radiation.

> Cecil, if what you say is true you have come up with a
> revolutionary, new, lossless system. Congratulations!

You and I need to get on the same wavelength. If you think I believe
the conservation of energy law can be violated, you are sadly mistaken.
Interpreting my postings in the worst possible light won't help anybody.
I tend to try everything and discard what doesn't work. That leaves me
with things that work that are not in widespread use but do indeed work.

I was surprised that varying the length of ladder-line to achieve a match worked so well. I was surprised that a 13ft whip plus SGC was only one 'S' unit down from a bugcatcher on 40m. I was surprised that the 13ft whip plus SGC turns in a neglible performance difference from a bugcatcher on 10m-20m. I was surprised that my 75m kluge antenna yielded the same field-strength measurements during the shootout with and without the SGC tuner in the circuit. Whatever the SGC tuner put into the circuit to lower the SWR from 4:1 to 1:1 didn't take any power according to your instruments.

Oh, and another thing. You indicated that coax losses are neglible in mobile operations. With a 13ft whip on 10m, the SWR is high enough to cause less than neglible losses in 20ft of coax. With no coax, the SGC becomes a base loading network rather than a conventional antenna tuner.

From: dkg@value.net
Message-ID: <dkg.14.0727778C@value.net>
Source record: 195921

Does anyone know which pot to adjust to vary the RF output on the 2mtr
side of the IC-820H? Currently the settings are LOW=4 watts and HI=45 watts.
I'd like to change the LOW setting to about 20 watts for RS-10 work.

Thanks

Kimmie

Instructions for Duplexing a G.E. MVP
by Bill Putney
WB6RFW

These instructions will work for MVP's on any band. Before you start, test the radio completely to establish a benchmark for post conversion testing. It is better to find any problems that exist in the basic radio and fix them now. After the conversion you only need to find the problems you created. MVP C.G. encoder/decoders are pretty useless after the radio has been duplexed so now is a good time to get rid of it. Don't forget to replace the resistor between H1 and H2 on the System-Audio-Squelch board (The SAS Board). Most of the duplexing is done on the SAS board.

Remove the SAS board from the radio.

Cut the printed circuit land that connects J904 pin 2 to U902 pin 7. The best place I've found to do this is right near U902 pin 7 on the solder side of the board. There is a land that goes from U902 pin 7 to a via pad. This trace is only about 1/8" long and is shown in gray in the MVP manual Outline Diagram. I use an Exacto knife to make these cuts. Make two cuts perpendicular to the run of the land about 1/16" apart then remove the land in between by prying up one end and pealing the copper away. This disconnects the receiver oscillator control line so that the U902 no longer can turn the oscillator off during transmit.

Place a jumper between J904 pin 1 and pin 2. I do that right at J904 on the solder side of the board. This
puts regulated 10V back to the receiver osc. control line so that the oscillator is always enabled.

The next cut is a little harder to find. The line on the schematic that connects the junction of CR901,
U902 pin 6, and J906 pin 5 to the junction of R905, R906 CR905, C906 and U901 pin 7. On the schematic it's a nice straight vertical line just above U902 but on the board it runs all over the place in and out of via's, from the solder side to the component side and back again. The place I cut it is on the component side of the board near J905. Set the SAS board on the bench with the component side
up and the board oriented as shown in the MVP Manual Outline Diagram. On the Outline diagram you can see two component side lands that run parallel along the bottom edge of the board the whole length of J905. The bottom most land connects H16 to J906 pin 4. Don't cut this one... The one you want is the next one up. It kind of looks like and S on the board and runs between J906 pin 5 and a via just below U902 (next to H5). I make the cut near the end (pin 7 end) of J905 before it makes a

turn and goes up toward U902. Make the cut as described in 2) above.

All of the I/O lines to the radio can be found on the SAS board and should be connected before you put the
board back in the radio. PTT is at H17. This is a ground to transmit line. COS is at J912. This line is ~0.1V when the radio is squelched and ~9.0V unsquelched. Don't try to run a relay from this COS line. I'd use a CMOS gate to buffer it. If you're useing a modern controller chances are that it
uses COMS logic and the buffer isn't required. Mike in is at J913. This line has mic bias on it and
should be capacitor isolated. It takes about 2V P-P to drive the radio to 4.5 Khz deviation. Receiver audio is found at H16. This is unprocessed audio. It is not squelch gated and is not de-emphasized. There is ~4V P-P with 4 Khz deviation on an on frequency signal applied to the receiver. This should not be loaded by less than a 10K input.

Put the SAS board back into the radio.

Unscrew and unsolder the SO-239 antenna connector and remove it. (If this is a UHF radio I'd throw it away and get an N connector but it's up to you). After the conversion this will be the transmit antenna connector.
Unsolder and disconnect the coaxial jumper at H2 on the Filter board. Disconnect P1 (this is the antenna
relay control and can be cut off and pulled out of the harness or left alone. It won't do much when you're
through).

Remove the filter board from the radio.

Using solder wick remove as much solder from around the antenna relay can on the component side of the
board as possible. Also use solder wick to remove as much solder as possible from the relay pins on the
solder side of the board. If you can remove enough solder from around the pins you can break them lose
with a small screwdriver of knife when the solder is cold. This will make the relay easier to remove. With
a small pair of diagonal cutters grab a corner of the relay can. Using the soldering iron, heat whatever is stuck and remove the relay.

Now you need to remake the connection between the output filter and the antenna connector. I use a piece
of center conductor from a piece of RG-58 to do this in the hopes that the dielectric and the conductor
diameter will keep the impedance about right. This jumper should be placed as close as possible to the circuit board in the holes left by pin 4 and pin 7 of the relay.

Now you need to rig up an antenna connector for the receiver. THE MOST IMPORTANT THING HERE IS TO HAVE A CABLE WITH A CONTINUOUS SHIELD from the

receiver connector on the front end casting to the antenna connector. This means no voids in the shield around the connectors at each end. If there are unshielded parts of this assembly the receiver will hear the transmitter and the resulting desense will be unacceptable. Use a good quality connector like a BCN or TNC (or type N if you can make it fit...). I like all of the connectors to come out the back of the radio. This is real handy from the point of view of working on the radio later and looks real nice but is a pain to do. If you chose to do this (or put an accessory connector on the back panel of the radio) you need to take all the boards out of the radio and mask off the back of the radio from the rest with newspaper and masking tape to keep drill filings from getting into every nook in the sheet metal and causing problems later. Mount the connector as close to the edge of the cover opening as you can or it will hit the filter board when you put it back in. Make sure whatever connector and coaxial you use for this will make the turn to miss the filter can. You could mount all this stuff on the front (plastic panel) and save yourself a lot of work but it wouldn't look as nice and it only takes time to do it right.

If you choose to put an accessory connector on the back panel I suggest you put it near all the other
connectors. To make room for this you will need to remove the little sheet metal doodad G.E. decided to
put on the back of the radio. Don't forget to mask off the power connector especially around the base where it meets the back panel of the radio. Metal filings like this way of getting into the radio. The doodad is held by two spot welds.If you look carefully you can see where they are. Drill these down to the point where the drill is just getting into the back panel. Be careful not to screw up the power connector in the process. I put the accessory connector next to the power connector. I like 9 pin D type connectors. They are widely available and of good quality. The D shape makes them a pain to mount without a punch (the Greenlee punch for this is >$280.00). Get the connector as close to the edge of the cover cutout as you can. This keeps it up high in the exciter area and out of the way. You are working through two layers of sheet metal so be careful when (if) you tap the mounting holes as the tap tends to bind between the layers. Put the radio all back together now.

Put the output filter board back in and solder the transmitter antenna connector back to the tab on the
filter board.

Retest the radio to make sure it survived the operation.

That's all it takes to make a $100-$200 MVP nearly as good a duplexed radio as a $1,000-$2,000 MSTR II base station!

HI,

Any of you know if there are any mods for the ICOM Z1A?
Or any reasons that I should NOT buy one of these guys.

Thanks!

I'm using a Radio Shack dual band (2m/70cm) glassmount. It works pretty good - advertised at 2dbi (2meters) and 6dbi (70 cm) gains. Make sure you have a SWR meter to adjust it though.

Hi Everyone,

I`ve been having a hell of a time getting the Ft-8000R to work correctly with my AEA PK-12 TNC. I using the rear packet connector on the FT-8000R. I can receive OK, and it seems that I am transmitting correctly, but the other ends doesn't seem to receive my packets. I have the exact same tnc/antenna/software working flawlessly using my FT-736.

If anyone can give me some pointers on what might be wrong, I would be very greatful.

Thanks,
Kory

Dear all

I've got an ICOM IC24SE, with receive range from (all approx)

120-180MHz
400-480MHz

and the radio also indicates that it can Rx around 800-900MHz,
at least the radio does not indicate "U". However I've never
heard anything in this range.

Is the radio actually receiving or is this a freak of the display
electronics?

Thanks

Dave Cripps G7IDB

Buy the 500 Hz filter for the first IF. Then later, if you want to get really sharp filters, you can buy the 250 Hz filter for the second IF. The 250 Hz filter is not available for the first IF.

2624. Need help 'with Atlas 210X Power Output Problem.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-12 00:00:00 UTC

Message-ID: <320F95CF.4567@hevanet.com>
Source record: 195931
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I have an ATLAS 210X that works fine on 40M up, but has only 60W
power output on 80M.
I think that the full power on higher bands eliminates a transistor
problem?
I've swept the output filters, they look fine and low loss, at least at
low power.
The ALC and SWR circuit had all the diodes blown. Can't figger out how
this could happen, but I fixed that. The ALC and SWR limiters are not
the cause of the limited power.
I've examined all the inductors as best I can without disassembling
them. No visible core cracks.
I've tried measuring voltages and comparing between bands. There's so
much RF floating around, that I have no meaningful results. Signal
substitution is out because of the way the coupling transformers are
made. I'm afraid to take them apart. Is there a way to test the
broadband transformers without removing them?

I'd appreciate any advice/experience with low output on 80M.
Thanks, miker

2625. Need schematic for Sommerkamp (Kenwood) TS624

>> : > Can the Icom z1a cross band repeat?? Tnx! David N4ZGT.
>> : Yes. Full- or semi-duplex. Your choice.
>> How do you activate it?
>Page 19 of the manual.

Page 19 of my Z1A manual describes how to operate Crossband full duplex (RX while TXing), and what they call semi-duplex (no RX while TXing - ie: simplex)

To enable cross band repeat:

1. Select the freqencies etc. on both 2M and 70CM that you want to use.
2. Place the Z1A in ALL LOCK mode with FUNC "D" (Until "ALL" appears in the text area). "L" will light in lower right corner of display.
3. Turn power off
4. Press MONI, RPT-M and "#" while turning power on.

"L" in lower right corner will flash, indicating that the Z1A is in cross-band repeat mode.

To disable cross band repeat, turn power off, perform step 4 above, then unlock normally (same as step 2).

Other useful undocumented feature:

Press "B" and "#" while turning power on - this allows tuning from 50 to 999 Mhz, although actual reception falls off a few 10's of Mhz from the amateur bands. I found it useful to pick up the weather channels etc. It also enables a "Place" setting in the SET menu, which allows you to pick the first digit position during manual frequency entry.

2632. Balun VS RF Transformer

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-12 00:00:00 UTC
From: Avatar <avatar@frii.com>
Message-ID: <320FD5C2.351D@frii.com>
Source record: 195939
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur

BALUN VS RF TRANSFORMER

I have read a number of postings in these news groups about using a balun at the output of a single-ended antenna tuner to feed a balanced line. Maybe the name balun was used as a generic name, but there is a difference in construction and operaton between a balun and an rf transformer. The purpose of this article is to point out those differences, so that others will apply the correct type as the application requires. The information here is intended to provide the basic concepts rather than in-depth analysis.

A balun (balanced-to-unbalanced) transformer is a special type of transformer. It is a transmission line transformer. A true balun has impedance transformation ratios of the power of 2 (ratios of 1, 4, 9, etc.) The balun must be built with a trans-mission line with a characteristic impedance equal to the geometric mean of the impedances to be matched. For example, a 4:1 balun designed to match 50 ohm unbalanced impedance to a 200 ohm balanced impedance should be built with a 100 ohm transmission line. In many baluns this line is two parallel wires with diameters and spacing to equal the 100 ohm require-ment and the power level.

If the balun described above is used at the output of a resistive 50 source and the load is not 200 ohms resistive, it will not properly perform its intended function. By the same token, if the load is 200 ohms resistive and the source is not 50 ohms resistive the same condition applies.

An rf transformer can perform the unbalanced to balanced function over a wide range of impedances when it is connected at the input or output of an antenna tuner. The transformer can be constructed with the same ferrite core that would be used to construct the balun, but an air wound coil also works. The toroid is wound with two wires in bifilar fashion, but the transmission line requirement for a balun does not apply. An air wound coil may use bifilar windings or just use a single winding with a center tap. The primary requirement is that the windings have sufficient inductance at the lowest frequency of operation. In either type of transformer the center tap is connected to ground. One end of one winding connects to the output of the antenna tuner and one side of the balanced load. The end of the other coil connects to the other side of the

balanced load. In effect, the transformer is a 1:1 autotransformer. The antenna tuner is doing the impedance transformation, not the transformer, it is performing the unbalanced to balanced function!

Less well known is that instead of connecting the center tap to ground on an air wound coil, connect the center tap to a grounded variable capacitor. Tuning the capacitor for each band often improves the balance/matching. I'm not sure why, but I suspect the tuning capacitor is compensating for the leakage inductance. While I have used this technique with air wound coils, I have not tried it with a toroid. It may be that the leakage inductance in a toroid is insignificant and a capacitor will not produce any appreciable improvement.

So, when describing use of an unbalanced tuner to feed a balanced load, please be sure you use the proper name for the balancing device to avoid confusion. If you really are using a balun in this type of application, you have limited the versatility and efficiency of your system for transfering power to the load.

I have a Motorola Micor VHF duplexed mobile radio for sale. The conversion and all work was done by Versatel in Casper, Wy. It's duplexed, tuned and has and interface for SCOM controllers. It transmits 40 watts and the receiver breaks squelch at .1 uV. It has not been put on the air as we have decided to use 440 instead.

I paid $390 total for the radio, duplexing, tuning, testing and shipping. I have retained the channel elements for future use. Will sell for $300 plus shipping.

Please E-Mail Rod Davis at: kc4neq@magicnet.net

2635. Re: IC-706 comments, opinions, caveats?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-12 00:00:00 UTC
From: n3usqn3usq@aol.com
Message-ID: <4uom76$1ul@newsbf02.news.aol.com>
Source record: 195942

Ed,

I bought an IC-706 earlier this year and love the little thing! I've used it in about every mode on just about every band and it works great. Traveled half way across the US and back this Summer with the radio under the dash and it performed superbly. Lately I've been running SSTV through it and having a ball. One compromise for the small package and multi-band features is a somewhat diminished ability to reject splatter from adjacent strong signals. I bought the narrow SSB filter for it, but that is only a marginal improvement. I would recommend getting the CW filter for it, instead (can put only one crystal filter in at a time). My bottom line: buy one!

Hope this helps.

There is no such thing as a good glass mount antenna when compared to a coax fed one. I would strongly suggest you get an "L" bracket that mounts on the edge of the recess for your hood or trunk lid. The coax is then routed under the edge of the trunk or hood and into the passenger compartment.

When I finally switched from glass to a coax fed antenna I saw a significant improvement in my ability to copy my repeater.

Source record: 195951

Hi, Fillippo and Rob.

My FT-736R is displaying signs of impending power supply failure too. It still works fine on all bands but six meters. There it is very intermittant. If I disconnect the internal power supply and use an outboard supply, the six meter problem disappears. Interesting, huh?

You would think that someone producing a radio as expensive as the 736R would make an effort to contact the owners in order to rectify the problem BEFORE it failed. Nasty things happen sometimes when a switched power supply fails.

This is my last Yaesu. Don't need the aggravation.

If anyone in the newsgroup is familiar with the two systems mentioned above... The IC-738 specs a triple-conversion superheterodyne receiver. The Kenwood 450 makes no mention of their conversion system, however they do mention DDS (Direct Digital Synthesizer) & PLL system. Opinions on which of these two systems have the better receiver would be greatly appreciated. Thanks.

I have a old crap 8088 'tole box' as you can say! With the power supply. It's rated 7Amp at 12 Volts but i'm wandering if i can use it to supply my mobile (used as a base) 13.8V tranceiver unit. I dont know much of switching power supply technology and i want to know if it's safe. The problem may be when i switch from RX to TX and from TX to RX... could there be a fatal burst of voltage? Or peraps with a big cap, like 22 000uF, at the exit i can control those peek?

Unfortunately, i dont have an scope to make charge test.

E-mail me on that please...

Thanks and 73 to all readers

I am selling the following stuff, because I will not be able to indulge in my hobby for the next several years (residential restrictions). I will probably just buy a new set when that time comes.

Please make an offer for each individual item or all of them:

o ICOM 751 HF All Band Transceiver
o MFJ 941 Antenna Tuner
o Astron RS-20M Power Supply
o Alpha Delta HT Transi-Trap surge protector
o Bencher YA-1 Low Pass Filter

I would prefer selling this stuff to somebody in Southern California. And I do not think it will be worth it for you to buy these if you are located outside the US and Canada, due to Custums restrictions, BTW, I live in San Diego.

Thank you.

>73, Cecil, W6RCA, OOTC
>
>1. There is no gain advantage using a 13' versus 8' whip on 10 meters.
In fact, maybe a slight loss.
2. In a previous thread I indicated it makes little difference in
received signal strength when matching a 3:1 or even 4:1 mismatch
by having the tuner at the base of the antenna or at the end of a 20'
quality coax in the cab, especially on 75 & 40 meters..
You then attempt to degate that statement with the scenero of using a
17m whip on 10 meters with it's 20:1 mismatch. You indicate the coax
loss will be "less than neglible" without including any numbers..
What is your deffiniation of less than negligible? Why didn't you
include the loss numbers the 20' coax would introduce working into a
28mhz 20:1 mismatch? In previous threads you indicate a -4 or -6db
is no big deal.
Assuming an impedance around 20:1 (r250 +j460) for 17m whip operated
at 28.5 mhz , 20' RG8/foam (VF 0.66), loss factor of 0.9db/100ft
/30mhz, the 20' coax total loss is around -1.61 db at 28.5 mhz. I
think the loss is excessive though the received end would never notice
it, but then again I would never use, or worse yet, recommend such a
system. .
3. You quote "Maxwell", but say your were "surprised" to discover (At
Visalia) no difference in signal strength with the SGC tuner in or out
of the line. Why?

4. I know no one who would attempt to change their mobile coil in the
"rain going 65 mph down the freeway"....Well....maybe...one person?

5. Yes. You are correct. We are not on the same "wavelength". My goal

is excellence not mediocrity.

w6kkt@frazmtn.com (Jesse Touhey (W6KKT)) wrote:
>1. There is no gain advantage using a 13' versus 8' whip on 10 meters.
> In fact, maybe a slight loss.

Everyone knows that whip gain increases from 1/4 WL to 1/2 WL to 5/8 WL.
I modeled a mobile antenna with an isolated 6ft by 12ft ground plane in
place of the car chassis. Both a 20ft whip and a 13ft whip had gain over
an 8ft whip. (That of course assumes that one has a near lossless
matching network). It only stands to reason, up to the point where a
double donut pattern occurs, the single donut pattern gets skinnier,
focusing the RF.

>You then attempt to degate that statement with the scenero of using a
>17m whip on 10 meters with it's 20:1 mismatch.

You're accusing me of something that is not in my dictionary so I can't
defend myself. I was not contradicting you, just expanding to include
higher SWRs. Mobile systems *can* have higher SWRs than your 5:1 maximum
with accompanying losses in the coax. (Most of my postings are *expansions*
on previous postings). Incidentally, I had this *exact* same discussion
with N6WR over something Kurt S. had written. Are you kin to Kurt?

>Why didn't you
>include the loss numbers the 20' coax would introduce working into a
>28mhz 20:1 mismatch?

We covered exactly that subject in extreme detail a few months ago.
It's interesting to see someone who didn't read the earlier postings
jump in on the losing side. :-)

>Assuming an impedance around 20:1 (r250 +j460) for 17m whip operated
>at 28.5 mhz , 20' RG8/foam (VF 0.66), loss factor of 0.9db/100ft
>/30mhz, the 20' coax total loss is around -1.61 db at 28.5 mhz.

A lot of people still use RG58 for mobile, even at VHF/UHF. With
RG58 one loses half one's power in 20ft of coax with an SWR of 20:1
on 10m. Move the matching to the antenna base and one loses 0.5dB
in the RG58 - quite a difference.

>but then again I would never use, or worse yet, recommend such a
>system. .

And that puzzles me. You recommend non-resonant length fixed antennas.
Why is mobile any different? Why is a tuner plus ladder-line plus a
non-resonant top section good at home but a tuner plus a non-resonant
whip bad for mobile? Mobile antennas must be resonant but fixed

antennas don't have to be? Anybody who has ever base-loaded a mobile antenna was doing exactly what the SGC does. The base-loaded whip that I beat (snicker, snicker) in the shootout certainly was not resonant on 3995. If you include the coil it was and if you include the SGC, my antenna was also.

>3. You quote "Maxwell", but say your were "surprised" to discover (At
>Visalia) no difference in signal strength with the SGC tuner in or out
>of the line. Why?

I don't understand the question. I don't recall Mr Maxwell saying anything about lossless antenna tuners. I simply assumed there was something wrong with your instrumentation because I'm pretty sure the SGC is not lossless while dropping the SWR from 4:1 to 1:1.

>4. I know no one who would attempt to change their mobile coil in the
>"rain going 65 mph down the freeway"....Well....maybe...one person?

I assume you know humor is allowed especially if one identifies it with a :-) which I try to do.

>5. Yes. You are correct. We are not on the same "wavelength". My goal
>is excellence not mediocrity.

There's room in this hobby for people like me, who try to achieve the mostest with the leastest. Remember the guy who only had a bent pin but caught the fish anyway? Remember the guy who lashed together three pieces out of his junk box and beat a screwdriver and a Hustler? :-) Do you wish I hadn't showed up for the shootout?

2657. Help with HTX-100.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-12 00:00:00 UTC
From: Wally@moor.slip.uky.edu
Message-ID: <1350.6797T1228T898@moor.slip.uky.edu>
Source record: 196062

I purchased an HTX-100 in brand-new appearance today at a hamfest for $60, been looking for a ten metre mobile rig forever.. Of course the 100 is near huge, but oh well.. :)

The basic memory/store/vfo functions are no big deal.. But I don't know about two-button commands it might have, etc..

Also, the power cable confuses me, outside conductors are positive and negative for the power leads, but what is the antenna lead, ground? I have left it unconnected. Made a few local contacts with it so it does work.

Also, could someone point me to a place describing how to adjust the deviation or mic gain? The radio is really hot, I have to hold the mic about 6 inches away and talk really quiet. My Icom 2m mobile rig is the opposite, so I keep overdriving the 100 by accident, and I'm told it sounds horrible when I do.. :(

Thanks for all help!

Although a bit off the antenna topic, I just have to respond to this.

On a scale of annoyance, "emoticons" (those strange symbols such as
:-)) rank just below 'fingernails-on-blackboard.' First, they often
don't denote humor, but rather obfuscation of a cutting or satirical
remark, in a sense implying, "I'm going to send an insult to the
recipient, but follow it with this humor symbol so that the remark can
be taken as either an insult or joke. If they're offended, I'll claim
it was a joke, and if instead they take it as a joke, then I'll have
slyly insulted them without their notice."

Secondly, they're patronizing. Does the user of the symbol think we're
so dense that we can't understand humor when we read it? Or that their
style of humor is so subtle that we, the great unwashed, won't notice
it unless it's pointed out to us? Give us credit for some brains, at
least!

The English language is an incredibly rich and textured language,
expressive, subtle, and sublime. Many great masterpieces have been
written over the ages, and in not one does an emoticon appear!

Express yourself clearly. If you think there's the chance of the
reader misunderstanding, then you're *always* better off trying to find
a better, cleaner way to state it, rather than following it with an
emoticon.

2661. IC-706 -- Loss of Display

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-12 00:00:00 UTC
From: edwin bailen <n5kzw@eden.com>
Message-ID: <Pine.BSD/.3.91.960812081244.15724B-100000@matrix.eden.com>
Source record: 196066

I installed an IC-706 with a remote front panel in my truck on Saturday and it worked fine. When I came back a few hours later (while the truck was sitting in the hot Texas sun), the display would not come up. The radio functioned, and all of the front panel controls appeared to work, but the display (LCD and backlight) was gone. Cooling the display off in the house did not help, but the display came back when I connected it directly to the radio. It continued to work when I connected it back up to the remote cable.

This morning, the display was dead again. I haven't tried re-connecting the display directly to the radio again, but I will this afternoon.

Is this a common IC-706 problem? Is there a known cure?

Regards,
Ed -- N5KZW

There is a reason those symbols were invented. Emotion doesn't
transmit well on internet postings. If all one posts are dry
non-emotional boring postings, you don't need them. Flames,
arguments, disagreements abound on the internet and demand
some form of communication to indicate ones emotion on a subject.
Emoticons have a place on the internet. ;-(

>> > of wire 8.2 feet and the other braided end to a length of wire the same

>> > size.

I hope when you said splicing, you ment soldering the braid to one of
the 8.2 foot wires and center to the opposite wire. Never splice
coax. Use proper connectors.

>here is your problem. A dipole is a symmetrical antenna, while the coax is
>asymettrical. Secondly, the impedance of a dipole, whether open or folded
>heavily depends on the height above ground (measured in wavelengths). I agree
>that the height of 8 foot (which is 2.4 meters if I am correct), is by far not

>BALanced/UNbalanced = BALUN, see your manual) it should be possible to get an
>SWR of 1:3 which is good enuf to work with.

You do not have to use a balun on a half wave dipole! It will do
nothing for your SWR unless you are using it for a transformer ie; 4
to 1 ect.

>> I suspend both ends using insulated clamps between two tree's,
>> > making sure that the whole antenna is parallel to the ground and it's 8
>> > feet above the ground.

Get the thing up as high as you can. Use rope to tie off the end
insolaters and keep them away from any foliage of the trees..

>Try using trees further away and use for the extension of the wires nylon line
>or at least several insulators. An insulated clamp is just a capacitor for HF
>energy. Experiment with trees at various distances and various hights !

You only need three insolators, one at the center to seperate the two
lengths of the wire and one on each of the other ends. Look in the
ARRL hand book or antenna book. There have been several picturs in
QST articles on construction fo dipoles. They really do work!

>> Now when I check the SWR, it's unbelieveable. Like

Make sure you are using 50 ohm coax! RG58 RG8 or RG8X are types of 50
ohm coax. You could use 75 ohm coax as well, but that would make the
best swr that you could get about 1.5 to 1.

>> -- If you are installing the PL-259 coax connectors yourself, check
>> continuity with an Ohm meter. RG58 coax can
>> be tough to solder properly and may short at the connector or have poor
>> joints.

>> switches, etc... so you are seeing the
>> antenna and not failed components between the transmitter output and the
>> antenna itself.

You should not need an antenna tuner to use a properly constructed
dipole on it's designed frequency!

One last thing, the formula of 468/freq is an approximate formula.
You may have to trim the length of the wires depending on the ground
conditions, height above ground other metal objects in the proximity
of the antenna ect.

Once you have the SWR down to something reasonable, try tuning up and
down the band to find the resonant frequency. Once that is done you
will know what to do to get the SWR very low in the area of the band
that you want to work. If the resonant freq. is too high, you have
to add wire to each end. If it is too low, you need to cut each side
shorter. But by all means try and keep both of the wires the same
lengh within about a half inch or so.

Good luck

Such an elegant posting, I hesitate to add anything. If one ensures that a 4:1 balun sees 200+j0 ohms, the balun will outperform a transformer over a wider frequency range - probably why TLTs were invented. I use a balun on the *input* of my balanced "tuner" to cover 10m-75m. It would be hard to do that with an air-core transformer without changing taps because of the 10/1 frequency variation.

In London, Ontario, Canada. ($CAN)
2 Meter Amateur Radio Amplifier

Looking for an amplifier for 2 meters?

Custom home brewed with front end helical filters to reduce intermod dramatically and in many cases, entirely! 300 mW to 1.0 Watts input will give out about 30 watts at 13.8V. Small and compact with 50% of the casing being a thick heatsink. Requires between 6 and 7 amps continuous in transmit mode.

Minor internal losses allows for 1 watt of input.

Spec's for power module:

Maximum ratings on Motorola MHW613 power module

Storage and
operating Temp..... -30 to +100 deg C
DC supply Voltage..... +16V
RF power in..... 500mW
RF power out..... 40W

Asking $125.00
$160 with antenna.

Also have a 2 bay vertical folded dipole antenna for 138MHz to 174 MHz. $45.00 Made commercial grade.

Please call (519) 438-5656 ASAP. Leave a message if no one answers.

hi there, I have two radios for sale. One is a very dependable mot. motrac curently crystalled on 53.31 (-1mhz tx offset) for Mt. Wachusett in central MA(covers almost all of MA, central CT, and southern VT and NH, And 52.525 simplex. Aftermarket tone unit installed. I have the matching control head, mic, original speaker and complete wiring harness, all in very nice cosmetic cond.. Will ship for $100 or $80 pickup or delivered within 1 hr of Boston. The second radio is a midland ht, model 70-045-48a, low band low split 29-36 mhz. This is the full display, 99 ch, user programmable tone version AND it works on 10fm. I will program to your specs. The unit is in virtually perfect cosmetic condition (some very minor scratches on the bottom of the display) Electronicly mint. comes with a duck and hi cap. (1300 mAh) battery. I am asking $350 or best offer, cod overnight shipping included. Email me or call Will at 617-237-5928. 73, Will, N1PXA

You probably would be better off going with the IF that is reached first by the incoming signal. Eliminate the interference at the beginning to avoid images, etc...

I think that in the 450 (I own one too) the first IF is the 8.83. I actually have the 450 and it came with the 500 hz CW in the 455 IF. Works fine. I'm probably going to get the 1.8 khz ssb for the 8.83, and then maybe the 270 hz CW for the 8.83.

You should probably check on which IF is first, though. I couldn't find it in the instruction manual, but I think that what's above is ok. Try calling kewnwood, or mailing them over the net.

Good luck!

2687. ADI Premier AR-446 INFO?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-13 00:00:00 UTC
From: santhony@ucar.ucar.com
Message-ID: <4uq7l1$53a@news1.ni.net>
Source record: 195975

Does anyone have experience with the ADI Premier line of Mobile Radios? They are the only company around that is not charging a fortune for a 440 mono-band mobile. Any comments would be appreciated.

ADI AR-446 is the model of interest.

Thanks,

KD6TSK - santhony@ucar.com

There are several. Have you performed any mods to it yet or
is it still virgin?

One cosists of cutting a jumper and another consists of removing a
surface mount diode.

` Are you aware that QST carried an article in the July 1992
issue that shows how to build an ICOM computer interface for a few
dollars versus paying $100 to ICOM. If you want more info I can look
and get specific issue information.

2690. CORRECTION AR8000 FILTER MOD

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-13 00:00:00 UTC
From: wm8p@infinet.com
Message-ID: <4uq9q4$ion@news1.infinet.com>
Source record: 195978

IN THE FOLLOWING I LIST A DPST SWITCH, ALL THAT IS REQUIRED IS A SPST. WHEN I ORIGINALLY DREW UP THE PLANS I USED A DPST BUT THEN REALIZED A SPST WOULD SUFFICE. HOWEVER WHEN I TYPED THIS UP I HAD DPST BRAIN LOCK. SORRY FOR THE ERROR.

Hello AR8000 owners,

To my knowledge no one has actually posted a filter mod, here is what I did. This is my approach and I only know it works well on my AR8000. Your results may vary. Others may have a different solution that works better or worse.

THE GOOD NEW:
Is it worth the effort. In my opinion YES!
The search mode is vastly improved on the SW bands. Search stops on the primary frequency and not 1 or 2 times before and after. Readability of SW stations is vastly improved. In some receiving instances it reduces adjacent channel interference noticeably. On AM receive for aviation frequencies a pronounced improvement in audio quality is noted. You will be able to select WIDE or NARROW for AM, NFM, USB, LSB.

THE BAD NEWS:
This is a difficult mod to perform. I have been a ham for over 30 years and have extensive homebrew experience. It took all my skill and a magnifying glass to perform this mod without damaging the radio. IF YOU ARE NOT QUALIFIED DO NOT ATTEMPT THIS MOD!
Find a qualified helper.

There is no way to adequately describe the locations on the circuit board to be cut and soldered too. You will have to buy or borrow a service manual.

Study the electrical mods described below and then using an ohm meter and the service manual find the locations to modify on the circuit board.

WHAT IS MODIFIED ELECTRICALLY:
The 4khz filter (F4) circuit is paralleled by a a jumper that is used to bypass the filter for WIDE reception. This selection process is accomplished by switching diodes on each end of the filter and bypass.

Find U2 pin 11 (AM, FM filter bypass) line. Trace this line to a 22K resistor that connects to the switching diodes (near the F4 filter). The voltage from pin 11 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the 22K resistor.

Find U2 pin 4 (SSB, CW filter inline) line. Trace this line to TWO 22K resistors that connect to the switching diodes (near the F4 filter). The voltage from pin 4 is used to bias these diodes into conduction. Cut through the circuit trace at a convenient location just before the TWO 22K resistor junction.

Unfortunately there is no way for me to put a schematic in for this next part but if you draw it out on paper you should be ok. You are going to mount a small switch on the radio. This must be a DPST switch.

Connect a wire from the WIDE side of the switch to the single 22K point.

Connect a wire from the NARROW side of the switch to the dual 22K resistors point.

Connect TWO 1N914 style switching diodes together to the switch common.
Connect them with the black band facing the switch.
Connect U2 pin 11 to the open end of one diode and U2 pin 4 to the open end of the other.

What you have done is to install a switch to reverse the normal filter selection of F4. The 1N914 diodes serve to prevent turning on the BFO in the AM mode and to prevent grounding when in the WIDE SSB mode.

If you have questions you may email me but if you post a reply all may benefit. I make no guarantees, your results could vary. You might not have much fun performing this mod but you will enjoy the results.

Well, it is that time again! It is Hamfest Season, and it is time
for the annual Duke City Hamfest! Here is all the information:

WHEN: Saturday, August 17th - Sunday, August 18th
TIMES: 8:00 AM-5:00 PM (Saturday), 8:00 AM-2:00 PM (Sunday)
WHERE: National Guard Armory, 601 Wyoming NE, Albuquerque, NM

* * FEATURES * *

* VE Testing (Saturday at 1:00 PM) * Outdoor Tailgate Swapfest
* Hourly Door Prizes * Grand Prize Drawings
* Search & Rescue Forum * Contests
* On-Site T-Hunt * ARRL Forum
* MARS Forum * AMSAT Forum
* RV Parking (Sorry, no hook-ups)

* PACKET FORUM - Information, plus the start of NM's Packet Users
Group!!! Please sign up!

TALK-IN FREQUENCY: 147.15 (+ No PL) Repeater

* * PRIZES * *

Grand Prize: Yaesu FT-840 HF Transceiver
Second Prize: Alinco DR-150 2 meter mobile
Third Prize: Alinco 2 meter HT

* * PRICES * *

Tables without Power: $10.00 each
Tables WITH Power: $15.00 each
RV Parking: $10.00 per Night
Raffle Tickets: $2 each, 3 for $5

See everybody there!! Please E-Mail me if you need any information
before the Hamfest.

Best of 73,
Brian, N5ZGT

<snip>

Best advice is don't use a glass mounted antenna. I've had two by
Antenna Specialists. They are touchy to adjust and ineffective.

I think you'll have much better results with a CushCraft or Larsen
mag mount or one of the Comet or Diamond antennas.

Hi everyone,

Does anyone know if it is possible to retrofit a CTCSS module to a Kenwood TS-790E? I think that the US version has this feature, but the model sold in Europe does not.

The radio belongs to a friend who cannot now access his local repeater, which has recently switched over to CTCSS.

I'm not licenced and none of this makes much sense to me, I'm just doing a friend a favour. Any help would be appreciated.

Thanks!

2707. SWR HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-13 00:00:00 UTC
From: sherman@marconi.w8upd.uakron.edu
Message-ID: <4uqarm$3td@kira.cc.uakron.edu>
Source record: 195995

Actually, a 250 ohm resistor would be a 5:1 SWR, and a 300 ohm would be 6:1.
250/50 =5, 300/50 =6. Be sure that you use NON-INDUCTIVE resistors, otherwise
the readings will be way off. Try this: Get a coaxial tee connector, and
connect two dummy loads to it. These will be in parallel, so the impedance
will be 25 ohms, and this will give a 2:1 swr. I'm not familiar with the 949c, but I have a
949E, which has a cross-needle meter. If you have a cross needle meter, you can transmit
backwards through it (reverse the connections) into a dummy load, then you can adjust the
reflected meter to read forward power (yes, this works, I have done it with mine).

2708. Summary of Comments OmniVI vs FT1000MP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-13 00:00:00 UTC
From: "John L. Merrill" <n1jm@dreamscape.com>
Message-ID: <32112877.1E25@dreamscape.com>
Source record: 195996

OmniVI vs FT1000MP
Summary of comments

1. A couple of people had microprocessor problems with the OmniVI possibly due to a high RF envronment. Others did not.
2. One person claimed some top dxï¿½ers/contesters changed to an "offshore" rig after using the OmniVI.
3. Internal noise claimed to be 5-6db less on OmniVI
4. QSK on OmniVI not as good as OmniV.
5. Some didnt like the construction of the OmniVI.
6. OmniVI has some operating quirks(no details).
7. FT1000MP works perfect out of the box.
8. Great radio if you only do cw(OmniVI).
9. FT1000MP quiter claimed receive audio.
10. OmniVI advantages: service, U.S made, cw filters sound better.
11. Buy FT1000MP without internal supply-runs cooler.
12. Filters are expensive for FT1000MP.
13. Some people have had service problems with both.
14. One person thought FT1000(MP?) was vastly inferior to TenTec Scout and other rigs during Field Day. Horrible Yeasu service.
15. Other advantages or disadvantages were concerning operator preferences, whether one had a tuner, second receiver, and other bells and whistles.

If anyone has more comments , I would be interested in seeing them.

73, John N1JM

Manny,

Everything I've ever heard about the Miracle Baby has been bad.
Most people refer to it as a "$40 dummy load."

All severely shortened antennas compromise performance to a
greater or lesser degree. Even a full-size duckie (the 8"
variety) is many dB down from a half-wave or 5/8 wave antenna.

That being said, if compact size is your #1 concern, I've had
pretty good luck with my Maldol Active Hunter. It's bigger
than the Miracle Baby, but I've been pleasantly surprised by
its performance. Also, the Smiley Antenna Co. sells a 2m
stubby duck which performs about the same as the Active
Hunter, is equally short, but is fatter and less flexible.
The Smiley will probably stand up to rough treatment better
than the Maldol.

These products are available from most of the mail-order
ham stores.

Chris,
Did you enable the power-on reset alphanumeric mode described in the
manual?? I lost the memories and had a hard time understanding the Yaesu
manual. However, once you put the FT-11R into alphanumeric mode, things
work as described.
Good Luck and 73s,
Ed--AA1IN

One problem with switching powel supplies is wideband noise. I used a
stock Yaesu switching PS a while ago, and with low and
shortened antennas the noise was overwhelming. It was OK with high
full-sized antennas.

That PS once gave up at a thunderstorm, something that has never
happend with the conventional PS.

I am looking to purchase a new mobile dual-bander to put in my Ford Aerostar. I will be travelling and so power is a consideration, 2m and 70cm bands are the two primary at this point. FM operation only at this time. I have an older 2m all mode that will stay with me put is not "installed." Any advice will be well-received as I have not bought a radio in about three years. Advice on antennas and mounting on my Aerostar would be great as well. I know all you have an opinion. Please e-mail it to me.

Thanks!

The 13.8vdc on the microphone hot lead is probably for powering a
pre-amplified dynamic microphone or an electret condenser mic that
requires bias. This is usually normal and you do not have to worry
about it if you are using the right microphone.

Radio Shack sells a preamplified microphone that could probably be
wired up to work, however the cost may not be worthwhile, as that
radio is pretty old, and has some major limitations in addition to its
dearth of features. If it was an IC-280, it would probably be worth
making it run, but the IC-230 is old enough technology and limited
enough to make one think twice or THREE times before pouring any
dollars into it, IMHO.

Yeah, the part number for the operator's manual is MU 1901101.
However, don't expect Tandy National Parts to send you an original
manual -- they only have photocopies available at a cost of $6.64
each plus tax and $2 shipping. Same holds true for the service
manual too (part number MS 1901101).

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-14 00:00:00 UTC
From: lwjames@csn.net
Message-ID: <lwjames-1408961236120001@news-2.csn.net>
Source record: 195894

Here are a couple of problems with the Icom IC-706.
Does anyone have a solution?

The mike has no DTMF keypad for using autopatch or the other tone controlled features on many 2 meter repeaters. There is no optional mike listed which has them either. Is there any DTMF mike which will work, both physically and electrically?

The manual lists available tuning steps (in the TS mode) as .1, 1, 5, 9, 10, 12.5, 15, 20, and 100 khz. It actually is .1 ,1 ,5 ,9 ,10, 12.5, 20, 25, and 100. This is not too handy for 15 khz repeater spacing. Is there any magic key combination which will allow the 15 khz tuning step?

The tension seems almost non-existent on the tuning knob with the lever all the way down. Is there any way to adjust it?

Remove the front passenger interior kickplate. Remove the computer. Above and forward of the computer is a large (2.5-3") rubber gromet.
Put a slit in the gromet and feed away. I run vhf (50w) and uhf (35w) with no computer problems.

Don -

I too am a new Ham. My first purchase was an FT-51R -- I really liked the interface and display, the backlit keypad, and the niceness of the controls. The fact that it is really two radios in one was pretty neat, you could scan two freq's simultaneously for instance. 8-character names for memories was also useful.

All this aside, however, I am now using an FT-50R. I made the switch because of the following reasons:

- The 50R has a vastly improved wide-range receive function that gives it much of the functionality of a scanner. (76MHz - 999MHz)

- The 50R is smaller, but is also MilStd 810 rated (it can get wet, and be dropped without harm).

- The 50R supports DCS (digitally-coded squelch).

The 51's two-radio personality was a nice feature, but the most useful reason to have that feature (IMHO) is to have the 51 act as a mini repeater. A 5W repeater is not very practical to me.

All in all, I think the 50R is the better general-purpose radio, especially if it is likely to be your "main" unit.

I hope that this helps.

IF WHAT YOU SAW WAS A BLACK OR GREY WIDOW ON THE DISPLAY WHEN IT WAS OFF
INSTEAD OF THE USUAL CLEAR THE FOLLOWING APPLIES.

The darkening of the LCD (display) is a standard feature. Your display
is probably actually still working, it just looks black and has no
contrast. This is common for LCD's operating above their temperature
rating. My 706 display always comes back fine after it cools down. I
have it mounted so an air conditioner vent cools it. Please note that I
live 60 miles from Death Valley and outside temperatures in excess of
120 are not uncommon. I have a couple of kenwood 742s in my truck as
well as the 706. They do not darken up. This probably indicates a
different LCD material choice for hot conditions by kenwood and the 742
display is much smaller. I have never had a problem.

You may want to check your connections and make sure the control head is
geting good voltage. After a display has darkened up it may need the
rated voltage to clear it off. the other possibility is that the dash
board was still hot.

IF THE DISPLAY WAS CLEAR

The remote cable connection on the radio or display may be marginal and
the heat causes the contacts to open up. I have some concern over the
strange compression pin connector on the control head.

Good Luck,

Bill Harwood

Source record: 195902

Hi folks I hope someone can help me. I'm getting back into ham radio after an absence of many years. I was able to get my hand on a Century 21 and Triton IV. I know very little about the radios. I do know that the Century 21 is a CW only radio and would suit my purpose of increasing my code speed. I have contacted TEN-TEC and ordered manuals but I would like to get general opinions about the radios. Should I bother to fix them up. When they were new did they work well enough or should I start looking for something better

Thanks in Advance,

Chris WB1CGF

2749. Kenwood TS-870 Can't Hear

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-14 00:00:00 UTC
From: rlubash@poco.mv.com
Message-ID: <Dw5CF1.4H8@mv.mv.com>
Source record: 195905

I have a Kenwood TS-870 who's receiver went almost dead a month ago (could only pick up 1 or 2 very strong stations way down in the noise). I did a CPU reset and changed antennas and tried different antennas on the 2nd input but to no avail. An IC-775 I was doing a review on at the time worked fine on the different antennas. I called Kenwood and sent the radio to there service center. When I called to check on the radio they said it worked fine and checked out within specks and returned it.

Now... a month later the radio has gone deaf again. This time it will pick up one local AM station very weakly and some of the stronger nighttime 40 meter stations. Before I send it back to Kenwood again I was wondering if anyone has had this problem and knows any possible fixes (I have already opened up the radio and checked connections on ribbon connectors ect).

Thanks in advance,

Yes indeed they are work fixing, Ived owened both, and they are solid rigs! They dont have any bells and whistles but they are good rigs! You can learn a lot from TEN-TEC gear, Both rigs are early 80s vintage. Look at the schematics when you get manuals and you will be able to understand what is going on. The triton had one of the quitest receivers you could get at the time and would be better than most made now! The Omni came after the Triton and had a really good receiver! I have owned seven of the Omni's. TEN TEC also has first class service. Good luck with them! 73's

> is... There are two 500Hz filter options availible. 1st IF and 2nd IF.
>
> Is there an advantage to one over the other? I would greatly
> appreciate any input on this subject. Thanks.> .

Ben,

As a happy TS450 owner, I might be able to help here. I used both the 8.8mhz and 455khz 500 hz filters and did not notice too much of a difference. I eventually replaced the 455khz with the 270hz narrow CW filter--love that one!!!! If you are serious about CW consider owning both. If you don't need the 270hz, I'd probably put the 500hz in the 455khz IF.

My .02 worth!

>I noticed it does some funny things to other electronic devices when I
>transmit on high power. >Is this kind of stuff normal?

Yes, it is "normal." Your transmitted field strength effects unshielded or poorly shielded sensitive electronics. This is why a HT can scramble some cash registers.

I would be EXTREMELY concerned about the brake light. If you are effecting that, are you interfereing with the brake system in other ways? Some anti-lock systems are rather sensitive... You do NOT want to key up at 70 MPH and lock up your brakes! This really has happened!

Most electronics that are tested for EMI resistance are tested at 10 Volts/meter but 45 Watts at close range can produce fields easily over 100 V/m.

Hi I am new to hamradio and in my local store radio shack htx202 is
selling for $250 and the ADI-200 is on sale for $159 which one is better?.
These are 2meter hand held. They both come with NiCd battery and wall
charger and antenna. The radio shack also has an alkaline battery pack
and it is extra for ADI. They both have one year warranties. The shack
has an option of 5year extended warranty; they also will accept returns
within 30 days of purchase. The ADI-200 has a seven day return.
Has anyone had problems with ADI 2meter HT??Is it about the
same as the HTX202 RS??

From: mreising@aol.com
Message-ID: <4usa7u$hbp@newsbf02.news.aol.com>
Source record: 196017

I've had one since the beginning of the year. No problems at all and I have been very pleased with it. Just one comment, the separation cable is only 5 feet long, long enough to mount under a seat but not behind the seat in my pickup truck. I bought two cables and coupled them together for a ten foot cable, HOWEVER, Alinco does not recommend this approach. they claim that you may pick up stray signals in the long cable or otherwise have problems with the control head communicating with the radio because the microprocessor for the entire radio is in the control head. I have not had a bit of problem with this approach but cannnot say what your results may be.

There is a grommet in the firewall (I forget which side) where the
electrical harness runs to the engine compartment.
If you take a pocket knife and slice thru you can then run your power
wires thru this slit.
I ran a pair of 8 gauge wires thru there with no problem.
Good luck
Ernie

2781. Alternate microphone for IC-706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-15 00:00:00 UTC
From: wpaperman@msmail.his.tch.tmc.EDU
Message-ID: <199608151011.FAA13292@pan.bcm.tmc.edu>
Source record: 195824

In response to a question regarding a microphone with touch tone capabilities for the IC-706; I have successfully used the microphone from my IC-2340H's. Deviation (measured) remains the same (4.5kHz) for both voice and touch tone (4.0kHz) without changing any audio level adjustments. The connector is the same. AEA lists the HM-77a as an alternate microphone.

Any program capable of sending/receiving data via the serial port will do. I'm experimenting with the database Panorama that has a serial I/O module. Later I'll convert it to Future Basic. I'd imagine you could also use older terminal communication programs like Zterm and write scripts to send the appropriate commands.

Subject: FS: 30W 2 Meter Amplifier w/IMD filter and 2 BAY Antenna

In London, Ontario, Canada. ($CAN)
2 Meter Amateur Radio Amplifier

Looking for an amplifier for 2 meters?

Custom home brewed with front end helical filters to reduce intermod dramatically and in many cases, entirely! 300 mW to 1.0 Watts input will give out about 30 watts at 13.8V. Small and compact with 50% of the casing being a thick heatsink. Requires between 6 and 7 amps continuous in transmit mode.

Minor internal losses allows for 1 watt of input.

Spec's for power module:

Maximum ratings on Motorola MHW613 power module

Storage and
operating Temp..... -30 to +100 deg C
DC supply Voltage..... +16V
RF power in..... 500mW
RF power out..... 40W

Asking $125.00
$160 with antenna.

Also have a 2 bay vertical folded dipole antenna for 138MHz to 174 MHz. $45.00 Made commercial grade.

Please call (519) 438-5656 ASAP. Leave a message if no one answers.

Subject: FT 736 PS unit to repair

Hi, Fillippo and Rob.

My FT-736R is displaying signs of impending power supply failure too.
It still works fine on all bands but six meters. There it is very inter-
mittant. If I disconnect the internal power supply and use an outboard
supply, the six meter problem disappears. Interesting, huh?

You would think that someone producing a radio as expensive as the
736R would make an effort to contact the owners in order to rectify
the problem BEFORE it failed. Nasty things happen sometimes when a
switched power supply fails.

This is my last Yaesu. Don't need the aggravation.

From: lwjames@csn.net (Dr. Lawrence W. James)
Subject: IC-706 problems

Here are a couple of problems with the Icom IC-706.
Does anyone have a solution?

The mike has no DTMF keypad for using autopatch or the other tone controlled features on many 2 meter repeaters. There is no optional mike listed which has them either. Is there any DTMF mike which will work, both physically and electrically?

The manual lists available tuning steps (in the TS mode) as .1, 1, 5, 9, 10, 12.5, 15, 20, and 100 khz. It actually is .1 ,1 ,5 ,9 ,10, 12.5, 20, 25, and 100. This is not too handy for 15 khz repeater spacing. Is there any magic key combination which will allow the 15 khz tuning step?

The tension seems almost non-existent on the tuning knob with the lever all the way down. Is there any way to adjust it?

From: rlubash@poco.mv.com (Richard Lubash)
Subject: Kenwood TS-870 Can't Hear

I have a Kenwood TS-870 who's receiver went almost dead a month ago
(could only pick up 1 or 2 very strong stations way down in the noise).
I did a CPU reset and changed antennas and tried different antennas on
the 2nd input but to no avail. An IC-775 I was doing a review on at the
time worked fine on the different antennas. I called Kenwood and sent
the radio to there service center. When I called to check on the radio
they said it worked fine and checked out within specks and returned it.

Now... a month later the radio has gone deaf again. This time it will
pick up one local AM station very weakly and some of the stronger
nighttime 40 meter stations. Before I send it back to Kenwood again I
was wondering if anyone has had this problem and knows any possible
fixes (I have already opened up the radio and checked connections on
ribbon connectors ect).

Thanks in advance,

From: sherman@marconi.w8upd.uakron.edu (David Sherman)
Subject: SWR HELP

Actually, a 250 ohm resistor would be a 5:1 SWR, and a 300 ohm would be 6:1.
250/50 =5, 300/50 =6. Be sure that you use NON-INDUCTIVE resistors,
otherwise
the readings will be way off. Try this: Get a coaxial tee connector, and
connect two dummy loads to it. These will be in parallel, so the impedance
will be 25 ohms, and this will give a 2:1 swr. I'm not familiar with the
949c, but I have a 949E, which has a cross-needle meter. If you have a
cross
needle meter, you can transmit backwards through it (reverse the
connections)
into a dummy load, then you can adjust the reflected meter to read forward
power (yes, this works, I have done it with mine).

Yep. I've heard bad things about the miracle baby. I guess they call it
that because it's a miracle if you can get a QSO with it! :-) There is
an antenna of similar length that is supposed to do much better but I
can't remember which one it is.

Art: This is usually bad solder connections on the the display board, particularly the connections that feed through the board. The feed thru ones are usually a dissimilar metal like brass that can be removed and replaced with a piece of copper wire.

Richard,

You have used the two HTs, what do you think of the pasition
of the anttena and the dial on FT50R. I am still looking at the
variuos options available. I feel that the rubber ducky comes
in the way of the dial while operating (when I am right handed).
What do you think.

2793. HTX100, delay after key/bad audio.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-15 00:00:00 UTC
From: Wally@moor.slip.uky.edu
Message-ID: <1362.6801T124T2407@moor.slip.uky.edu>
Source record: 195836

I recently purchased an HTX100, and have noticed that after I unkey there is a delay before the receive audio returns. It seems to receive (meter still registers) almost instantly, but the audio doesn't return for 150ms or something. Enough to lose a word every now and then when someone quick-keys..

I figure it's some hystersis, but maybe some way to fix it.. Resister value change or who knows.. *shrug*

Also, I keep receiving reports that my audio sounds bad, as in my voice peaks make me sound like I'm overmodulating, but I don't have a really boomy voice and I am holding the mic at ~6". When I pull the mic out to about 8" or 10" my audio goes down but still sometimes gets noisy on my voice peaks. Wiggling the mic and such doesn't cause/stop it or anything.. Would like to get the problem worked out, hate to have bad audio.

Thanks for any help!

Compiled by Bill Childers, KE6VVW

Disclaimer & Other Nonsense
The information in this document is a guide to the FT-50 ONLY. Having had more than a few radios in my amateur experience, I understand how most hams wish to learn as much about their rigs as possible. I have compiled this guide to allow other people to learn more about the radio without having to search all over for information. I do not guarantee the validity of this information, as Yaesu may change programming or hardware so that some of the techniques in this document may cease to function. I am not responsible if these instructions damage your rig in some way. All I can say is that I have performed the following procedures to my unit, and I am quite pleased with the results. Your mileage may vary, etc.

History

Version 1.0
1st introduced.

Version 1.1
Added: Game mode, Changed High Power Mod to "Internal System Alignment". In this section I also detail the squelch and S-meter adjustments. Also added info to the bug on the FTT-12 Keypad.

Introduction
The Yaesu FT-50 is perhaps the most unique VHF/UHF Handheld manufactured today. It's made to MIL-SPEC 810, for dust, splashproofness, and vibration. Out of the box, it has not only dual band 2m/440 capability, but wide FM receive and AM receive as well. In addition, it receives 76-200 MHz, 380-500 MHz, and 700-900 MHz (Cellular Blocked). It has one of the fastest scan speeds for an amateur HT. It also has the unique ability (w/ ADMS-1C software) to interface with an IBM PC running Windows and have memories and settings uploaded/downloaded. In addition, it has DCS (digital coded squelch), ARTS (auto-ranging transpond system), and Yaesu's excellent transmit and receive battery saver features. It also uses Yaesu's extremely efficent FET power module that allows for 5W+ of output power with a 9.6V battery pack. With the optional FTT-12 keypad, the unit also performs CTCSS decode, DTMF paging, and also incorporates a Digital Voice Recorder! All of this functionality in such a small package makes it my rig of choice.

Problems (Bugs)
Unfortunately, the FT-50 is plagued by a few bugs. None of them are very serious or life-threatening, just a bit annoying. First among them is its Wide-FM receive. Apparently Yaesu engineers didn't put a wide enough filter in the unit, and some of the bandwidth of broadcast FM signals gets "chopped off". This means that the rig is near useless for listening to music on the broadcast FM band. It works marginally with voice only on the same band. My opinion on this problem: If you want to listen to music, bring a small Walkman or other transistor radio with you. The '50 does an adequate job of bringing voice signals in on broadcast FM, so it's good for listening to emergency broadcasts.
The second "bug" lies in the optional FTT-12 keypad. The manual for the radio states that you can set up a "voice mail" type of functionality that lets your radio operate unattended and record calls for you. This mode doesn't work correctly, although the built-in voice recorder works great. It seems that the unit will playback the wrong voice partition. The problem appears to be in the DTMF page-answer-back area. If you're buying the '50 and FTT-12 solely for this purpose, DON'T! It doesn't work and there's no current workaround.
The third bug has been complained about a bit. It seems that some `50s suffer from a low Tx audio problem. This is due to a factory adjustment that is set a bit on the low side. It is easily fixed. (See Factory Adjustments below).
The fourth "bug" is synergistic with the ADMS-1C software. If there is some kind of problem in downloading a file to the radio, the software aborts with an error, and the rig is left with it's memories cleared in a "limbo" state. This state is actually the European band plan, and if done properly, the rig can be modified to receive even more frequencies... which will be described later. (See modification section) However, if you want to return the rig to its natural state, simply download a blank frequency file (NONAME.RDF) to the unit. All should be well.

Factory adjustments
If your rig suffers from the low Tx audio problem, here's how to fix it.

1. Remove the battery and antenna.
2. Remove the "NiCd" sticker on the heat sink. If you remove it very carefully, it's possible to re-install it later with the same stickum that's on it.
3. Look in the cavity where you removed the sticker. Proceeding from left to right, here's what you'll see...
Phillips head Screw (Holds the keypad in)
Small Silver Potentiometer (VR1001--VHF Deviation Adjustment)
Small Silver Potentiometer (VR1002--UHF Deviation Adjustment)
Small White Potentiometer (TC1001--DONT TOUCH! CTCSS Tone Adjustment!!!)

Phillips head Screw (Holds the keypad in)
4. Take a small Phillips head Screwdriver and turn both VR1001 and VR1002 about 1/8 turn clockwise. This will increase the VHF and UHF deviation and fix the low Tx audio problem. If it's not enough Tx audio, simply turn both pots another 1/8 turn. Make sure to turn both pots the same amount!
5. Replace the NiCd sticker, battery, and antenna.
6. You're Done!

Internal System Alignment (May not work on some radios)
NOTE: This setting appears to work on radios that have NO MEMORIES programmed. You might want to try STEP 3 before clearing your memories. If step 3 doesn't work, you probably need to clear your memories. BE CAREFUL with these settings... it's possible to really mess the rig up by setting some funky squelch or something... you might want to write the default settings for your rig down.

1. Select 2m VFO frequency.
2. Turn the radio off.
3. Push LAMP, PTT, Knob, and PWR at the same time. The rig will turn on with the squelch open, so turn the volume down!
4. The '50 will display "BAND xxxxxx" where xxxx may differ depending on your radio and whatever mods you may have performed.
5. Turn the top knob. There are a variety of settings available. Here is a listing of them:
· HSSQ: Squelch Hysteresis Adjustment, adjusted by the dial.
· THSQ: Squelch Preset Threshold
· TISQ: Squelch Preset Tight
· S1LV: Low-Scale S-1 Adjustment.
· S9LV: S-Meter Full Scale Adjustment.
· HIPO: Hi Transmit Power Adjustment: Should be calibrated for 5W (Can be pushed higher with a 13.8V Supply)
· L3PO: Level 3 Power Adjustment: Should be adjusted for 2.8W.
· L2PO: Level 2 Power Adjustment: Should be adjusted for 1W.
· L1PO: Level 1 Power Adjustment: Should be adjusted for .1W.
6. Select the adjustment you wish.
7. Push in the Top knob. There will be a "s" that appears next to the displayed number.
8. Rotate the knob to change the setting.
9. Change other settings, if desired.
10. Push the knob for more than 1 sec to save the profile.
11. Select 440 VFO frequency.
12. Repeat Steps 3-10 to adjust the UHF Settings. UHF Settings will have a "U" in front of them.

Modifications
The FT-50 is extremely easy to modify. The first modification is performed for you at the factory... but for those of you who accidently disabled it, or changed it... here it is.

Extended U.S. Receive Mod (Expands receive from 144-148 & 430-450 to 76-200, 380-500, 800-999 `cell blocked') NOTE: All memories will be erased.
1. Turn the transceiver off.
2. Hold down the Knob and Lamp keys while powering the unit on.
3. The unit now has U.S. Extended Receive.

MARS/CAP mod (Extended Transmit Mod: app. 144-159, 420-470) NOTE: All memories will be erased.
Don't transmit on bands that you're not licensed for!! Besides being illegal, it creates problems for people using those frequencies.
1. Remove battery & antenna
2. Remove NiCd Sticker on Rear Heat Sink
3. Loosen (Don't Remove) Philips head screws on rear that hold keypad in.
4. Use screws as thumb holds to press keypad out.
5. Remove screws.
6. Remove Keypad.
7. Under Keypad on Left Side there is a series of Solder Jumpers. They are labeled in white from 1-3. Only #1 will have solder jumpering it. Remove the solder, being careful not to damage or touch any other components. WARNING: If you're not good at desoldering, or have shaky hands, you might want to have someone else do this for you. It's REAL easy to damage the rig.
8. Reinstall Keypad. Be careful of the O-ring around the keypad. Make sure it's not twisted or damaged, as the waterproofness of the unit could be compromised.
9. Install sticker, battery and antenna.
10. Hold down Knob and Lamp keys while powering the unit on. (Extended Receive Mod as above.)
11. Completed!

Super-Hyper Awesome Mod... The mother of all Mods!!! (Requires ADMS-1C software and MARS/CAP mod to be performed)
Receive: 76-999 Mhz (No displayable holes!!!)
Transmit: 120-221 Mhz, 320-499 Mhz (AGAIN, Don't transmit on frequencies where you're not licensed)
NOTE: This mod will disable ARS (automatic repeater shift) and will set 2m and 440 repeater offset to
weird numbers. Make sure you enter repeater offset and +- shift manually. Repeater offset needs
be set once for the rig, then it should be able to be forgotten about. It will also clear memories.
Remember above where I mentioned the ADMS-1C software having a bug? Here's where the enterprising and curious ham can take advantage of that. This mod will install the European band plan in your radio...so without the MARS/CAP mod you will lose the top portion of your 2m band.
1. Are there frequencies in your radio? Don't want to lose them? Simply get the data from your radio as it sits... you can "merge" the frequencies later. Save the file.

2. Perform the MARS/CAP mod as outlined above. Get the data from the mod and name it USA.RDF.
3. Attempt to send the same data to the radio. In the middle of the transfer (around 50%), pull the adapter cable to the PC out of the radio.
4. Thanks to the bug, your radio is now in European mode! Perform the Extended Receive Mod by holding the Knob and Lamp keys down while turning the unit on.
5. Now, the Automatic Repeater offset doesn't work. There's no workaround. Note that the 2m offset has been changed to 0.00. Go to the menu by holding down the knob. Go to SHFT, Option 7. Press the knob. Turn the knob so that it reads 0.60. Press PTT.
6. Now, turn off the radio. Put it back into clone mode. Read the data back from the radio to the PC and save the file as EURO.RDF.
7. If you want to enter frequencies manually or using ADMS as normal, go ahead. Everything should work. If you saved frequencies as above, open EURO.RDF and "merge" the frequencies from your USA.RDF file into it, and save it as another name. Then send the modified EURO.RDF (your filename) file back to the radio using the "template" file EURO.RDF. You're done!
8. To return the radio back to the U.S. band plan, send the USA.RDF file back to it.
Note that I have no way of measuring the sensitivity of the frequencies or the output power of the rig outside of the ham bands. The 220 coverage seems to be very poor, however, the radio does display 220 frequencies. It won't transmit on our 220 bands, though. 800 Mhz receive is vastly improved.

Game Mode
The FT-50R includes an interesting "game" that's programmed into it. Here's how it works:
1. Power up the radio while holding down the MR key. (PWR + MR).
2. The display will show GAME on the left side, and Spd 1 on the right. You're in game mode!
3. By rotating the knob, you can change the speed of the game. Higher numbers are faster.
4. Press PTT to start the game.
5. Numbers will start to scroll across the screen from left-to-right. As they come, you are supposed to push the number on the keypad that makes a sum of ten, followed by F. Example: 6 appears, press 4, F. If 0 appears, enter 10 followed by F.
6. The game is over when the screen fills up with numbers.
7. To exit the game, simply cycle the power.

> > Is there an advantage to one over the other? I would greatly
> > appreciate any input on this subject. Thanks.> .

I have a TS-850S with the 500 Hz filter in the 455kHz IF. I chose it over the 8.83 filter because it has a much better shape factor. Both filters have a 6 dB bandwith of 500Hz. But at 60 dB points, the 455 filter's bandwith is 820 Hz compared to the 8.83 filter's 1.5 kHz. So the 6:60 shape factor for the 455 filter is 1.64, compared to 3.0 for the 8.83 filter. In crowded band conditions you'd appreciate the difference.

The long pins between the top and bottom boards of the counter often
get oxidised and make poor contact with the push thru sockets.
Just pulling it apart/reassembling will sometimes fix it for a while.

Another trick I was put onto was to give the pins (all sqaure section)
a 45degree rotation with pliers - that way they make GOOD contact!
Fixed my problems way back then.

Cheers. Murray Kelly vk4aok.

Hello Eveybody,
I am looking for a HyGain tape measure dipole antenna. This antenna
is actually two tape measure built into one piece, including the
feedpoint. All you do is pull out the apporopriate amount of tape to
operate on your frequecny, and you are on the air!
If you, or anybody you know, has one of these antennas for sale,
please E-Mail me as I am interested in taking it off your hands!
Thank!
72/73,
Brian, N5ZGT

Art,

I, too, am having a similar problem with my TS-820S. The problem is only on
the 20M band. What its doing is showing superflous segments on the last three
digits...and only on 20M. I have already had the thing in to Cliff
Holland/Tucker's in Dallas. He worked on it and it stayed fixed for 30 days -
the length of his personal warranty. Now its flaky again.

If you hear of any suggestions via Email, would you please pass them my way?

Thanks,

Hello Everybody,
I am looking for a good color camera to use with ATV. I am
particularly interested in buying a small one, for a reasonable price,
to be used on a balloon or RC airplane.
If you know where I can get one, or have one for sale, please E-Mail
me. Thanks!
72/73,
Brian, N5ZGT

The same thing happened with TS-850's when the new TS-870 came out.
Even I sold my '850 at that time to upgrade to an '870. This just
happens from time to time when a swarm of new rigs come out and we
all scramble to have the "latest and greatest" to impress out ham
buddies with. Such is life :)

Actually there's one case where this sort of dummy load antenna is
exactly what you want, and that's on a hilltop when you're working on the
repeater. You need a way to transmit at low power with ERP low enough not
to swamp the receiver you're working on. I remember last time I helped with
a repeater installation, there were a couple of guys who had these sorts
of dummy load antennas - looked just like the new Comet thingie - and they
were very jealous and protective of them, because neither one had any
idea where they could buy another.

>I cannot get the SWR reading below 6:1.

Probably a bit late to be joining in the fray, but what are you using for insulators, most particularly the center insulator. The reason that I ask is that I recently read that some PVC compositions can be _conductive at RF_. Now that's nasty, eh? I often use PVC pipe for small antenna projects.

I can't remember where the article was, but it suggested an easy way to check your particular piece of PVC. Put a glass of water (as a "safety valve") and a small piece of the PVC into your microwave oven. Turn it on high for 1 minute. Check the PVC for any noticable warming (to the touch.) If not, repeat immediately for a second minute. If still no warming, then the PVC is usable for your antenna projects.

Stop triming that antenna! Forget the length of the
antenna unless you plan on using it for one and only one
frequency. Get an antenna tuner to provide a proper
conjugate match and return any reflected energy back to the
antenna so it can be radiated. One of the MFJ's for
$100-300 new is just fine. If your feedline loss is low
(as it usually is at HF frequencies and typical amateur
feedlines), high SWR's that are dealt with using an antenna
tuner are of no concern whatsoever.

If ever you were to get a 1:1 SWR (ground losses were
eliminated, the height above ground was perfect, no
parasitics were nearby, etc.), you'd only be able to use it
for that one frequency. Boring if no one else is on that
frequency! Generally, anyone who gets a 1:1 match across
the band with a dipole is warming the ground, their
feedline or some nearby parastics.

Cheers,
Peter

I dunno, Peter, what *is* the threshold SWR to worry about? If a coax-fed dipole cut to length is not even close, there may be something else wrong, like one side of the transmission line not making contact.

What I do is measure SWR on the band edges. One edge is usually a lower SWR that the other indicating which direction resonance is in. If I couldn't get a coax-fed 1/2WL dipole lower than 6:1, I think I would be worried also. Now if it is fed with ladder-line, an SWR of 6:1 is perfectly understandable.

>
>I'm considering a purchase of the Alinco DX-70, anybody have any + or -
>comments on it?

I like my DX-70T. It performs quite well, and all of the audio reports I've received when running it mobile have been great. It's a superb rig for dedicated mobile use. Its performance seems far greater than its diminutive size would imply. The receiver is sensitive and the audio is excellent coming out of the tiny speaker. This is the first mobile rig I've ever owned that didn't require an external speaker! I've owned and used Kenwood's TS-130 and TS-430, Icom's IC-730, Ten-Tec's Scout 555, Radio Shack's HTX-100, Uniden's HR-2510 and HR-2600, and a number of various 10m converted CB radios in mobile service over the years, and the Dx-70's audio beats them all, hands down. The display is easier to read than any other I've used to date in mobile service (it's an LCD).

There are a few drawbacks, as with any rig. Band changing is jsut a bit tricky, but that's not a big deal in mobile use, as you have to stop to change antenna taps or resonators anyway (unless you're running one of the expensive, complex, self-tuning antennas, which I'm not, I use the excellent Outbacker Perth). The CW filter is not very effective (but that's not a problem if you're not running mobile CW). The cable for separating the control panel from the main chassis is too short, and they don't sell a longer one. I have heard of people making their own, or buying two cables and joining them together, but Alinco cautions against this. I'll probably do it anyway. The noise blanker is WORTHLESS. Alinco offered a "factory upgrade" to fix problems with the blanker, but I hear it made little or no difference so I didn't bother sending my rig in. I often wish the rig had continuously variable output power, but it doesn't. That's really no big deal either.

All in all, I highly recommend the DX-70T. It does everything most of us would need in a mobile HF rig, for a great price, and it's small enough to fit it many of today's smaller cars and trucks.

>
> Todd...
> tadunlap@centuryinter.netSituation:
If the LCD dims or a part of the LCD segments does not display anything
when set to the frequency display mode.

The display will return to normal operation when you press the lower part
of the display with your finger.

Fix:
This trouble is due to insufficient contact at the connector. The
connector between the control unit and the LCD assembly. Sometimes this
situation arises because of slight pressure in the mounting of the LCD.

Either reduce the thickness of the connector from 1.1mm to 1.0m so there
is less pressure on it. You can replace the connector:E29-1123-15 to be
changed to E29-1123-25. Kenwood will be happy to fix any radios that
have this occurence.

I really had trouble finding that hole in the wall that was
mentioned on here at the time I installed my radio.

I put a Kenwood 742 remote unit in the little cubby holes in
the very back, ran the cable/control/power up to the
back passenger seats. Ran the power through the floor, and
the control cables up the console area.

Worked out pretty well.

I need to install through the roof antennas now. Havn't taken
off the head liner, that might be a huge task? ANYONE DONE IT?

I do know better than to drill the holes in the roof right
on the cross-beams. I have seen people make that mistake before.

Well <>
IMHO
I think you should re-calculate your power requirements
a 2.2 KW generator is a tad bit small
one 15 amp 125V service will run ya 1875 Watts
and If it was my generator I would not be loading it that close to 100%
for house useage I would not look at anything smaller than 5kw
might as well have a generator just humming along instead of STRAINING :-)

Yes have a electrician install some sort of switching device so
the generator and mains are not connected at the same time !
no use going to JAIL since you just killed a couple of linemen a few miles
away while you where backfeeding the power lines!

Good Luck

There is a cw filter included, but it's not cw bandwidth, measuring 1.6
Khz wide at -6db in mine in the narrow mode. There's no better optional
filter, and the filter (such as it is) is not available in sideband mode
for use with digital modes. The noise blanker is, as others have noted,
worthless. I can't tell when I have it on or off.

As a base station, if you plan to use it with transverters, there is a
quirk that might be a problem. If you operate split and try to operate
split mode, the mode used in receive is forced on transmit. Not usually a
problem, but if you are using a transverter for inverting satellite
transponders, this means you have to manually change sidebands each time
you go into transmit.

As a dedicated mobile rig, with no need to run cw or digital modes, it's
not a bad choice. It gets consistenly good transmitted audio reports and
is easy to use while driving. But it doesn't deliver on two of it's
claimed features (cw filt and NB) and neither one is a trivial issue,
especially if you want to operate modes other than voice.

The radio seems to be an improvement over the TS50, in virtually the same
package. The ICOM seems better thought out and does have optional cw
bandwidth filters, and the optional filter is available in LSB/USB for
use with digital afsk.

Your choice depends on what features are important to you and the cost
factors. Good luck.

Check out Maldol Active Hunter (I think thats the name) A little bit taller seems to
have better performance.

Hickok 533 Dynamic Mutual Conductance Tube Tester - $100 plus shipping

Working (or no known problem). Octal-8 (e.g., EL34 & 6550) socket is seriously worn. I STRONGLY SUGGEST immediate replacing it and putting in a socket saver. Please do not buy this if you do not know how to or plan to do it.

The wood case is in good condition. The black vynl cover on the wood case is not so good.

Please email or call 360-896-8312 (eve) if interested.

Girjesh -
I was actually a bit concerned about that myself. I found that after only a day or so with the 50R, I was not bothered by the position of the antenna vs. the position of the main knob. The 50R is so "palmable" -- it fits extremely well in either hand -- that just about any way that you hold it is comfortable. The side buttons (PTT, monitor, and lamp) can be operated by either the thumb of the left hand, or the index and middle fingers of the right hand. I usually hold the 50R in my left hand, and wrap my thumb and index fingers around the antenna to "pinch" the knob with my right hand (if that makes any sense).

>
Tom,

I have an Icom IC281H 50 Watt 2 metre transceiver which has extended coverage of the 118 - 136 MHz AM aircraft band on RX only and 136 to 174 MHz on FM TX & RX. The UHF FM RX only coverage is extended to 320 to 999 MHz. The sensitivity on the a/c band is good, I can hear most local activity out to about 50 miles using a 145 MHz end-fed half wave whip about 20 ft agl. I don't know the details of the mod as it was done by the suppliers in London, but if you're interested I can let you have their e-mail address.

From: Jim S <Saeger@gat.com>
Message-ID: <32150035.317A@gat.com>
Source record: 195793

What I did...

I have a 4KW single phase 120 VAC Generator with on board breakers of 15/15 amp or 1 at 30 amps. My house is wired with two of the three available phases for all house circuits. I have made a patch cord that plugs directly in to the dryer (220V) outlet with the 30 amp single phase generator output going to BOTH of the "positive" lines... Before using the generator, I open the main breaker at the house service box which isolates the house from the street and I unplug all of the 220 volt equipment in the house (dryer, stove, microwave, linear, air compressor, etc.) because there will be no 220 VAC.. That is, I will have only a single phase at 120 VAC.

This does not have all of the safety features that the power company wants. Infact they insist on removing the physical connection in the meter entirely if and when they notice. But it will power the whole house and 4KW is not too big.. particularly if you are starting any motors like for the furnace, airconditioners (only if 120 VAC)

The lighthouse on a dark street.... JimS

But was it still working? One reason people complain about the HTX-202
is that they have unreasonable expectations for it, and little experience
with other HTs (others just have to bad mouth anything that says Radio
Shack on it for some unexplained reason). It's a rugged and reliable
radio as these things go. No, it isn't a Motorola HT220, but then nothing
else is either. It has the best intermod resistance of any of the amateur
HTs, and on sale it can be had for an attractive price. Radio Shack's
extended warranty is also unique in the industry, even covering grossly
abused radios and *batteries*. It is a good cheap radio, and several others
which cost much more aren't nearly as good. It isn't a scanner (thank
goodness), and it doesn't play games, but as a two way handheld radio it
is quite satisfactory.

There are certainly smaller radios out there, and there are radios
with more "features" (though of dubious utility to two way communications)
out there, and there are even *better* radios out there, but those usually
cost more. To come in under $150 is tough unless you buy used. Radio Shack's
extended warranty is *transferable*, I don't know of any other radio
manufacturer who'll do that.

I don't want to *tell* you to buy Radio Shack, you might like something
else better (for example my current HT is a Standard C508A for particular
reasons of my own), but don't write off the HTX-202 just because some
malcontents hate Radio Shack for unknown reasons. There's a lot of plain
crap being circulated in the amateur community about this radio for
no good reason. (Admittedly, Radio Shack has sold some cheesy garbage
over the years, but the HTX-202 isn't in that category.)

I am planning on getting one this weekend too. I was suprised at the single DTMF memory as well, but the salesman at HRO said that was typical for mobile rigs. My HT has 5 DTMF memories. It seems like it would be reversed since the most difficult time to dial is while driving (probably should be avoided anyway), and easier on the HT while walking about.

From: adamkern <adamkern@tiac.net>
Message-ID: <4v0jjg$heo@news-central.tiac.net>
Source record: 195863

If you really want the best performance, you can cascade the filters. Install both, and then you'll end up with a slightly narrower bandwidth than 500 hz, and it will be razor sharp. I don't know about the shape factor of the filter, but I've read that if you have only one filter, put it in the first IF. This helps reduce images. However, I have the 455 khz filter for 500 hz cw in my '450, and it works great. The 8.83 might be better, but you won't be dissappointed with the 455.

I am seeking suggestions on which 2m HT to purchase. Would prefer to stay $150 or less, but a used radio in GOOD condition is acceptable.

I was considering a R/S HTX-202, but have heard of a lot of folks having trouble with them. I looked at a used one, but it was VERY abused.

Any suggestions on what to get, and what to avoid would be much appreciated. I'm new to this, so... please have mercy.

Greetings everyone,
Well, if you remember I was telling everyone about the situation dealing with Dylan Littlefield and how he refused the package I sent him. Well, after I posted a message about the situation, he got scared and finally wrote back. He claimed he never even received the package but, would be HAPPY to repay me the $14 shipping costs. I asked him 5 times now when are you going to send me the check? Anyways, he says anything to get off the topic of paying me. Today when I asked him, he said "It's only $14 it's not the end of the world!" Is this the same person to claimed he would be happy to repay me the money!?

Just want to warn everyone about this person... and keep you updated.

His screen name was : 103123.1142@CompuServe.COM (NewsBoy!)
When, he answered me 1 1/2 months later... it somehow changed to: Live4News

Look out when dealing with this person.... You might just get ripped off!

> for the furnace, airconditioners (only if 120 VAC)
> If I understand your post, you are replacing a dual phase power source with a single phase power
source, expecting that amperage is the only problem. I haven't worked with high voltage stuff for
20 years, but I would strongly suggest a meeting with an electrician.

220V outlets in homes usually mean you have 208 VAC dual-phase power.

This in turn means you have two 120 VAC lines, which are electrically 120 degrees out of phase
with one-another. The additional (third) phase brings you a full electrical 360 degrees of power.

Usually, your dryer's electrical motor will be wired to take advantage of this phase difference,
and you will either need to rewire the motor connections to work with single phase AC, or buy a
completely different motor. Failure to do so may invite your dryer motor (and any other dual-phase devices in your home) to an unplanned cookout. Or cookin.

There may be reasons you don't need to worry about this - since I've always wired 2 and 3 phase
motors to 220 2 or 3 phase supplies, I really dunno what might happen, but I've seen rewind shops
in the Navy arrange coils to use phase rotation to make the motor work - in fact, we used

to have
to check phasing with a phase rotation meter before bringing a motor back on line, if it had been
rewired. Failure to do so would have been disasterous in some cases (I'm thinking about missile
elevator motors - our officers had no sense of humor about pressing the "up" button, and having a
few tons of nuclear material go "down"). Fractional horsepower motors may be wired in a more
forgiving manner. See an electrician to be sure.

Generators are better than alternators, so you're off to a good start. However, keep in mind that any appliance with an electric motor is a big burden on a generator! Electric motors as a rule have an inrush current durring startup, that can be six times the normal running current! Most room air conditioners I've seen require more current than the average home generator can deliver. A unit that is rated for 120VAC, 15A, is approx. 1800 watts! I don't think a 2250 watt generator would be able to start it, even if it was the only device on-line at the time. Also, a better muffler than what normally comes with the generator will also reduce the horse power developed by the engine, because it will not be able to breath as well, i.e., a more restricted exhause, will result in less air and gas intake. This is why racing engines are so loud. As for the gasoline...I've kept a "full" tank in my motorcycle and lawnmower during the winter, and a "full" tank in my snowblower, over the summer, with no problems. I think the key here is to keep it "full"

so there is very little air to attack it. Plus you can always recycle the gas to and from your car every so often. You might want to consider about a 3500 watt generator for the application you have in mind. You can also rig up automatic power transfer systems, as well as automatic battery powered startups on your power system if you want to get fancy!

Bill Crocker

Source record: 195739

Alinco DR-M06 Six meter tranceiver question

Hi all. I've found two different sets of mod instructions that allow this rig to receive (and xmit, I guess) out of band. However, neither set was very specific as to the exact location of the jumper pads. Has anyone performed this modification that can give me some guidance?

Thanks for reading this,

Glen Menendez KD4EQI

2886. FT-50R & FNB-42 Battery???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-17 00:00:00 UTC
From: Bernie Skoch <BSkoch@postoffice.worldnet.att.net>
Message-ID: <4v5em8$hfk@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 195740

Has anyone used the FNB-42 9.6V 1100mah battery with the FT-50R?
Does anyone know if it will fit inside the NC-50 charger shells that the
FT-50R drops into? Those shells _just_ accept the FNB-41 600mah
batteries; if the 1100mah battery is any fatter I don't see how it
would fit...

Thanks for any thoughts.

MUX stands for MULTIPLEX, sending multiple information/data streams on
a single frequency. There are several different kinds of MUX, among them
are time division MUX and frequency division MUX. The explanations can
be complex, and I don't have time now to try to explain them.
Good luck,

Sam...

Scott Sidener wrote 8 lines on the subject: Anyone know what Motorola MUX stands for?; here's some of it:

>Hi, I just found out that my Motorola Micor has duplex/MUX.
>
>I was wondering what the MUX meant.

MUX is an abreviation for Multiplex, i.e. sending more than one signal on one carrier without mutual interference. See FDM (Freq division multiplex) and TDM (Time division multiplex).

Your radio, given that it features duplex and mux operation, might have been in service in an ambulance. Those sets could do simultaneous transmit and receive plus carry EKG signals from a patient to the hospital at the same time. Pretty neat, if you could train the attendant to use it.

Alexander Parkinson (alpark@freenet.mb.ca) wrote:
: Greetings

... and salutations! :-)

: Considering Radio Shacks new mobile, anybody have a product report on
: the HTX242?

I went ahead and got one about 5 months ago. I'm fairly pleased with it, although not perfectly happy with it. With my big hands, I find the microphone a bit of a bear to handle sometimes, and if I have a long chat with someone, I flip the lock switch on, so that I won't accidentally change channels whilst in the middle of my QSO!

I do wish it was a bit more sensitive, in the receiver portion. But, I'm comparing it to my HTX-202 h/t, which of course won't go out-of-band, and thus the h/t receives better. Then again, the ability to go listen in on the NOAA weather radios down here is nice. Also, listening in on various other media and stuff. :-)

However, be advised that I have it on good information that RS will be shortly introducing both a h/t and mobile dual-freq. radio; this comes from a _real_ RS rep that I saw at a nearby hamfest a couple of weeks ago, he indicates that they're in "beta" testing now, and they should definitely be out by the end of the year, if not sooner. So, stay tuned.

I've taken the liberty of appending an old service bulletin I downloaded
some years ago from the Kenwood bbs. It touches on many of these points,
and you may be interested in it......

73, Bob, VE7HS

SB-009

TS-820 Speech Processor Alignment 11-17-76

The following alignment procedure may be used in lieu of the one in the
Service Manual.

Test Equipment required:
Audio Signal Generator
Audio VTVM
Oscilloscope or RF VTVM

1. Preliminary control settings:
Screen grid switch off.
Mode switch to USB.
Comp Level to USB.
Processor SW to Pull "ON".
Meter switch ot "Comp".

Send/Rec switch to "Send" as required when making adjustments.

2. Apply 1500 Hz audio signal to the mic jack at 10mv level.
Connect RF VTVM or scope to TP-2.
Adjust T-11, 12, 13, for maximum level on the S-meter.
Adjust T-14 for maximum level on scope or VTVM at TP-2.

3. Turn compression level to min, (CCW).
Reduce audio sig at mic jack to 0.3 mv.
Adjust TC-4 (Freq response for speech processor) so that level at
TP-2 is not changed when changing audio gen from 400 Hz to
2000Hz.

4. Turn compression level to max, (CW)
Set audio gen to 1500Hz at 0.3 mv.
Adjust TC-3 and VR-6 (carrier bal for speech proc) for maximum level
at TP-2.

5. Set audio gen to 10 mv at 1500Hz
Send/Rec switch to send
Adjust VR-7 (comp level for speech processor) so that the level at
TP-2 is not changed when turning the processor on and off. VR-7
should be adjusted for the particular microphone the customer
will be using with his TS-820.

6. Finally check for non distortion of signal, and that comp level of
20db can be obtained at full comp on.

(c) 111776TKC

SB-024

General Notes on TS-820S 10-25-77

1. No output TX: SG switch is "OFF".

2. No TX, RX or VFO: There is no 9 Pin plug installed.

3. Low RX Sensitivity, no TX: The transverter switch is"ON."

4. S Meter full deflection when first turned on:
Makesure RF gain is not fully CCW.

5. If digital display does not count: Make sure DH is not"ON."

6. If there is no DG display: Make sure you are not in REMOTE VFO
with no remote VFO attached.

7. When intermittant in any circuit:

a. Check for loose black jumper from point to point on circuit board.
b. Check for broken foil path.
c. Check for component that has been pulled out or loosely soldered.
d. Check for solder splash across foil path.
e. Check for loose pins.
f. Check for component leads touching to metal IF cans.
g. Check for wire not soldered at function switch or at any switch
or control.

h. When checking FET's, check for excessive voltage at can top usually source, or same G-1, G-2 voltage.
i. Check for loose Molex mini connector or any foreign substance on pins.

8. Complaint of frequency shift when TX-CW: This is normal. 800 Hz.

9. Not proper PLL action: Make sure PLL slide switch is in NOR not TUNE.

10. Receiver audio self oscillation at high level: Make sure audio board mounting screws are tight.

RECEIVER

1. Low audio output receiver sensitivity and no transmit: -6v supply is bad. Q13 on FIX VOX unit.

2. 25 kHz calibrator will not zero: Add 3 pf in parallel with TC-1 on the marker unit.

3. Receiver sensitivity down: Q2 on RF unit. +9v on PD unit is shorted. L-6 shorted to ground.

4. Intermittant receive when moving set.: Check for touching terminals at final relay socket.

5. No receiver or digital: 14v wire pinched between DG-1 chassis and ground.

6. Receiver sensitivity 40 db down: Check for shorted L8, 1.8 MHz antenna coil on coil pack.

7. Adjacent signal interferance: See TKC bulletin.

8. No receive audio: Check for shorted TA-7201P module at X49-1080-00.

9. Poor receive audio: The 100 V AC 120 V taps were miswired.

10. Receiver doesn't work 20-40: Check for wafer touch to ground on band switch.

11. No DG1, no RX, no TX, no VCO: Bad D1 5 volt zener on relay unit.

12. RIT action seems warbly: See TKC bulletin.

13. Receiver has bad static and is noisy: Bad C14, C15, tantalum on PD unit.

14. VFO frequency shift: Check for loose tension of VFO tension spring.

15. USB/LSB will not work: Check for loose connection at C18 CAR-1 unit.

16. Intermittant audio: Check for loose mounting screws on audio board.

TRANSMITTER

1. Mushy audio on transmit: Mic amps Q20 and Q21 on IF unit are bad.

2. No 14V supply: Bad bridge diodes D8-D10 on X43-1090- 02.

3. Intermittant operation of any one band: Check for loosely soldered Xtals in PD unit.

4. Mic gain down: Cold solder joint at SSB xtal filter IF unit.

5. Self oscillation when TX: Bad final tubes. Burned cathode resistors 10 ohms R2, R3 at final unit.

6. No VOX operation. No sidetone: Burned resistor R12 220 ohms at key socket.

7. No USB or LSB: Check CAR1 X1-X2 crystal for cold solder joint on CAR-1 unit.

8. No TX: Check for shorted Q1 and Q8 balanced mixer on RF Unit.

9. No ALC meter movement: Readjustment of meter amp VR1, VR2 on IF unit.

10. Intermittant ALC action after peaking drive: One final tube is bad.

11. Fix lite on when in VFO position: Wire shorted terminals on function switch.

12. No loading of TX: Cold solder joint at relay socket RL1 antenna relay.

13. Using Sure 444 speech processor is distorted: See TKC bulletin regarding 16db pad for mic input.

14. No relay closure on TX: Q9 on fix Vox unit is bad.

15. Very low RF output only when using RF speech processor: Bad Q30 on IF unit.

16. Low RF output on SSB without RF speech processor: Bad Q20 on X48-1150-00.

17. Large audio difference between USb and LSB: realign carrier unit per TKC specifications.

18. No loading on 40 meters: Foil path is open on RF coil pack.

19. No tX when using send switch: Bad R28 1K and Q9 on FIX VOX unit.

20. Blows fuse: Check for shorted C21, C22 100uf 500v.

21. No drive, no TX or bias: Open screen resistor R6 470 ohm at rectfier unit.

22. VFO intermittant: Check for cold solder at VFO power plug.

23. Audio distortion on TX with processor: C96 may be loose on IF board.

24. Faulty LED indications: Check for loose ground screws on LED board.

25. Low output on CW: R14 470 Ohm touch to filter case on IF unit.

26. VOX operation is intermittant: Solder touch VS terminal oand 14v at X50-11350-00).

27. Intermittant TX: Make sure ground strap for 12BY7 shield is under the shield.

28. Insufficient power out to drive linear amplifier: An increase of 5-7 watts can be obtained by paralleling R6 on receiver unit with a 47 ohm 2 watt resistor.

29. VFO output level is down: Q2 inside VFO is bad.

30. No TX or RX on any band. No VCO output: Q14 on X50-1330-00 is bad.

31. No TX or RX: Loose contact VFO output terminal on Fix Vox unit.

(c) 102577TKC

SB-026

Service Note on DG-1 10-25-77

It is our experience here in the Compton service facility that the vast majority of DG-1 problems are not component failure, but cold solder connections on the digital circuit board X54-1160-00.

The second most frequent problem is dirty Molex connectors between the two circuit boards in the DG-1.

Recommended service procedure:

Remove both boards. Using a fine point, low wattage iron (45 or less), and a good quality low flux content solder, carefully resolder all component side connections plus the print throughs containing no components. (There are 18 of these points-only one is not accessible from the top, but is located under IC11 and can be resoldered from the bottom.) Resolder the Molex connectors. There are 9 print-thru's where solder may not have flowed thru to the component side.

Using a good quality tuner cleaner with silicone lubricant, spray both boards Molex connectors and work the pins in and out 3 or 4 times to insure good contact. Rassemble and final check.

Total time on the bench: 20 minutes. We will allow up to 1 hour only if in warranty.

JEB:adr

(c) 102577TKC

SB-019

New Display Tube for DG-1 12-21-77

The original display tube (LD-8109) used in the DG-1 digital display for the TS-820 and TS-820S has been discontinued by the manufacturer. However, there is a replacement tube available. This tube is the LD-8135. It is not a direct replacement for the original tube. The leads come out of both ends of the display tube instead of just one as in the LD-8109. Therefore, it will be necessary to replace the complete display unit if the display tube fails. The part number of the new display unit is X54-1310-00. Please use this part number when ordering a replacement display unit. The new display unit is being installed in the current production of the TS-820S and DG-1.

The new display unit (X54-1310-00) is a little more involved to install than the old one. The installation is as follows:

1. Remove the top cover of the TS-820 (or TS-820S) and set the unit on the bench so the front panel is facing you.

2. Remove the two screws from the original display unit (save them), unplug the display unit forom the counter assembly and remove the display unit from the transceiver.

3. Run the connector of the new display unit through the left bracket (from the center).

4. Gently (but firmly) push the right side of the display unit throught the right bracket. (This is the most difficult part).

5. Gently push the left side of the display through the left bracket.

6. Install the screws from the old display in the mounting bracket of the new display unit and plug the connector into the counter assembly.

7. Turn on the TS-820 (or TS-820S) and make sure the display tube works properly.

8. Replace the top cover of the transceiver.

(c) 122177TKC

SB-954

TA7201P Substitution Parts Kit 07/20/89

The Toshiba TA7201P audio amplifier (Q3) used in the TS-820(S) and R-820 is no longer available. The part has been replaced with a kit (Part # W05-0257-00). This service bulletin will provide the correct installation procedures for replacing a defective TA7201P with the new kit.

1. Disconnect the power cord and antenna from the transceiver.

2. Remove the covers from the transceiver and disconnect the speaker wire.

3. Remove the AF AVR board from the bottom of the transceiver (4 screws and 3 connectors).

4. Remove the two nuts that secure the heat sink to the audio amplifier (Q3) and then remove the heat sink. Figure 1.

5. Desolder and remove Q3, C21, C22, C26, C33, R40, R42, and R47 from the AF AVR board. C33 and R47 are mounted on the foil side of the board, but may not be installed on some models. Figure 1 and 2.

6. Using the parts from the kit, install a 22 uF capacitor in the C21 position, a 0.068 uF capacitor (labeled 683K) in the C22 position, a 3.9 ohm resistor in the R40 poisition, and a 470 ohm resistor int he R42 position. Figure 1

7. Solder a 0.1 uF capacitor (labeled 104K) in parallel with C30. Mount the part on the foils side of the AF AVR board. Figure 1

8. Remove the two nuts from the heat sink mounting srews. Figure 3.

9. Replace the mounting screws with the ones in the kit. If the original screws have been soldered to the board, remove the excess solder and while the screws are still hot, turn the board upside down to allow the screws to fall onto the working surface. Figure 3.

10. Secure the new mounting screws with the two nuts that were removed in step 8. Figure 3

11. Install the heat sink and secure it with the two hexagon bosses from the kit. Figure 3

12. Insert the wires from the new audio amplifier circuit board as shown in the diagram. Make sure the pins are firmly seated and then solder them into place. Figure 4

13. Apply a thin layer of silicon grease to the back of the audio chip.

14. Insert the circuit board into the heat sink and secure it with the two nuts that were removed in step 4. Avoid pinching the wires between the board and the bosses as well as the board and the heat sink.

15. Attach the heat sink spring from the kit over the chip. Figure 5

16. Assemble the transceiver by reversing steps 1-3.

Note: Due to the differences in characteristics between the TA7201P and the new audio chip, the noise level will be increased. The increase in noise will effect the position of the AF gain control. Should it be found that the audio is too low, the value of resistor R4 on the AF AVR board can be reduced from 220 ohms to 82 ohms. The resistor removed from the R40 position can be used in this situation.

(c) 103189TKC

(This bulletin is shipped with the W05-0257-00 parts kit. If you would like a copy of it just leave a note to the sysop with your name and mailing address.)

2899. Siemens RK 641 REPAIR HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-17 00:00:00 UTC
From: Brian Boulden <boulden@community.net>
Message-ID: <01bb8beb$545124c0$a077ae8c@boulden.community.net>
Source record: 195753
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

I have an Siemens RK 641, that I need some repairs done to it. Does anyone have the phone number or/and preferably the Internet address of Siemens in North America.

Or if you know of someone who is good at radio repair who can take a look at it. I am hoping it is not beyond repair. Right now I am considering sending it to C. Crane Company in Fortuna California, but they have a 4 to 6 week back up before they can even look at it :<

During the big western USA black out of August 10, when the power came back on my radio stopped working. My LCD display is all lit up and I get no sound. None of the switches work either, except the light switch.

I feel like I have gone "Cold Turkey" from Shortwave Radio.

Please respond directly to my E-mail address

Hi everyone

Has anybody purchased and put togather one of thos 2 mtr. mobiles that TENTEC sells you in a kit? All the articles I have read say all a person needs is a VOM and some time on there hands. If anyone has taken the challenge and bought one of these rigs let me know if the time and effort that it takes to assemble the thing is worth it. I know you can buy lot's of used gear for around the same price it'll cost for the kit but it's the joy of building it that has caught my interest.

Thanks Bob

Jese do you even have a PK-88? I got one for thirty five dollars and I
have never had a problem with it. Also the manual tell you how to hook
it up better then my kpc-3's does.

For whoever asked I will be happy to loan them my manual if they will
pay the mailing fee.

>friend

The big advantage of the FT51R over the FT50R is the former has
two receivers, allowing you to monitor two frequencies, in
different bands or in the same band, at once. The FT50R only has
one receiver. If you want to be able to catch a call on another
frequency *while you are transmitting*, there is no substitute
for the ability of the FT51R. It also allows you to run quasi-
duplex if there are a pair of linked repeaters within range,
IE you can hear yourself talking by monitoring the linked
system. That has some uses, especially to detect doubling.

OTOH, the FT50R is a better scanner, and has good loud audio
thanks to an efficient speaker design. That allows it to be
heard more easily when used in a car. But using a HT in a
car is a poor substitute for a real mobile rig. And of course,
since it lacks the second receiver, the FT50R is cheaper.

Hello Eveybody,
I am looking for a HyGain tape measure dipole antenna. This antenna
is actually two tape measure built into one piece, including the
feedpoint. All you do is pull out the apporopriate amount of tape to
operate on your frequecny, and you are on the air!
If you, or anybody you know, has one of these antennas for sale,
please E-Mail me as I am interested in taking it off your hands!
Thank!

> 73 de G0BVZ, Vic
> RSGB G-QRP AGCW ARCI(When I remember to renew!) SCAG DIGI have been using the SGC-230 tuner for several years. I like it.
All you need do is supply 12 volts, connecter your Radio and connect
the antenna. The antenna output is a ceramic standoff. The input is
coaxial. It will tune any antenna that is longer than 15 meters.
It remembers tune positions as long as the 12 volts is not removed but
even then tuning takes only a few seconds.
Hope this helps.

Does anyone have an inexpensive ($10 - $20) dummy load suitable
for use with my TS-820? Like maybe an old Heathkit or
something along that line?

Prefer dry type (or drained of oil so it can ship).

I don't need anything at all fancy - no meters, switches, tuners, etc.
built-in. Just 50 ohms at 100+ watts.

Let me know if you have anything!

>Craig KW9R
>

Craig,

I'm using it in a base configuration. I like it alot for this
use. Only drawback I see is the dip switches for PL tones are on the
bottom of the rig. I think these should be set from the front panel via
soft switches. Great receiver!

Source record: 195815

Hi. I'm getting back into amateur radio after about 25 years. Needless to say, many things have changed since then. I need a good rig to get my code speed up, and have the opportunity to purchase an IC-761. I'm estimating that it's 5-6 years old. It seems to work just fine (much better receiver than my old Hallicrafters), but since I really don't know about all this new stuff, I may be talking through my nose. I'd really appreciate any opinions, comments, or what have you that you folks could contribute!

Thanks in advance!

Does anyone know where I can obtain a program to control this radio.
It would seem that this would be fairly easy to do utilizing the
microphone connection and sending strings of keypress codes.
Before I sit down with my C compiler I thought someone might have
already written some code either to do this or for packet that might be modified.
Any help or suggestions would be greatly appreciated.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I've just picked up a Motorola Wattmeter S-1350C at a flea market and wonder whether anyone else has one or knows about these. It's a bit different from the Bird in that the entire line section is swapped for different frequency and power ranges, not just the pick-up.

The one I bought came with 2 duplicate 500W 25-100MHz (PL-259 term) lines plus a few less useful ones. I'd like to get some other lines and I'd be happy to trade lines with anyone with surplus or buy any appropriately priced ones that are available. If anyone knows of a source for these, I'd appreciate a pointer.

Message-ID: <4v64uf$1li@news0-alterdial.uu.net>
Source record: 195620

Hello,
I'm just getting started in HF. I'm looking to purchase a rig. I would prefer a portable rig but quiality counts for me. I've sort of narrowed down all the HF rigs for me to the Icom 706, Yaesu FT-900CAT, FT-990, or a TenTec Omni VI. Any opinions of comparisons would be appreciated.
Also, I need a verticle antenna, my location won't allow a tower and beams of any sort. The Cushcraft R7000 was recommended. I want a multiband that includes 160meters. I have found a verticle by Sommers Antennas out of Geneva, Fl. But no one in my area has one so I have no real way of knowing it's quality. Any comments here?

Thanks in advance,

Yepers!! The alinco 610 has a 9600 connection on the rear on the radio.
I am looking at the 610 my self. Its a nice rig. Thats one good thing
that I like about it! Ta Ta for now! De Kc5nnv \ 73's

On 14-Aug-96 09:53:12, Richard Abbot articulated:

>The Smiley will probably stand up to rough treatment better
>than the Maldol.

Actually, the Maldol antenna is a small spring in a flexable rubber condom, so I would say it should be pretty wear-resistant, and the spring isn't going to get damaged. :) I have used mine quite a bit and I have no tears or what not in the rubber.. The name has worn off of it, but other than that. Also, it being a spring, you can tune it. I didn't have to trim the antenna, I simply 'screwed' it onto the BNC base a little farther. It with a tiger tail is a pretty decent antenna for repeater work. WAY too effected by the body though, no good to wear it on your belt, it destroys the pattern and doesn't hear much at all.

Good antenna.. *great* for ducky-only DFing, you can take the condom off and it's a pretty good antenna still, just about 20db attenuated! And a decent lobe off the tip, I've 'pointed out' a fox before with it. (With better success than some ducky methods I've used).

I wonder what the Black Bullet Comet (or is it Diamond?) sells is.. It's about two BNC connectors tall.. Probably no better than being totally without an antenna.. :)

I'm waiting for the 9db gain 'Intenna' HTs to come out... *smirk*

Hello,

This is a listing for a freind.

For Sale:US Tower model TX472
- 73 foot free standing
- 4 crank up sections
- electric motor crank-up
- This is a big tower
- Paid well over $4,500 new in December 1990

Will sell for $2,600 you remove it and take it away
For $3,100 we'll include the UHF and VHF boomer arrays

Call Jean Moeschler at (916) 888-8883
Leave a message if no-one answers please

Thanks

2935. Wanted: Yaesu FT101 Info

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-18 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4v81bi$8va@pulp.ucs.ualberta.ca>
Source record: 195634

Hello,
Just recently came across an old abandoned FT101, and took it in as a backup rig. Finals are OK, and most everything seems alright except that transmit and receive are not aligned on some bands. Don't have the appropriate equipment, so the local ham store will fix that up. Seems that this one was used on 11m (I know, a lot of them were), and it has the AM filter in the CW filter spot. Has some out of band CB frequencies in the remote VFO as well. Got the setup with the VFO, the phone patch/speaker, and the outboard digital display (YC601). I am wondering about mods for the rig. I understand that there were a number of them. I have the info on the cap change for the new finals, and the 30m operation mod. I have heard about the AGC mod, but don't have the info. Does anyone have any mod info for the 101? Also, how much would the outboard display go for separately? Any experience or info with 101 much appreciated.
Chris VE6RDC

Since you have a boyfriend, I assume you're either gay or female...further assumption is that your boyfriend is gay or heterosexual...by offering me his address & phone figures...are you saying he's available...for hire...or what? Why do you think I would want his/her address?

If you're equating freq. with newsgroup...of course I won't leave; I never asked you to leave...just to cease your campaign aimed at ruining this person's reputation just because he/she didn't accept your stupid package.

One post would have sufficed to inform the group of this grave incident, but you have posted repeatedly...constant harping is annoying...please just lick your egotistical wounds & shutup.

This is my final post to the group on this matter...if you wish to take it to e-mail...fine.

James C. Marciniak wrote:
: If I understand your post, you are replacing a dual phase power source
:with a single phase power source, expecting that amperage is the only
:problem. I haven't worked with high voltage stuff for 20 years, but I
:would strongly suggest a meeting with an electrician.
:
:220V outlets in homes usually mean you have 208 VAC dual-phase power.
:This in turn means you have two 120 VAC lines, which are electrically
:120 degrees out of phase with one-another. The additional (third) phase
:brings you a full electrical 360 degrees of power.
:
: Usually, your dryer's electrical motor will be wired to take advantage
:of this phase difference, and you will either need to rewire the motor
:connections to work with single phase AC, or buy a completely different
:motor. Failure to do so may invite your dryer motor (and any other
:dual-phase devices in your home) to an unplanned cookout. Or cookin.
:
:There may be reasons you don't need to worry about this - since I've
:always wired 2 and 3 phase motors to 220 2 or 3 phase supplies, I really
:dunno what might happen, but I've seen rewind shops in the Navy arrange
:coils to use phase rotation to make the motor work - in fact, we used to
:have to check phasing with a phase rotation meter before bringing a
:motor back on line, if it had been rewired. Failure to do so would have
:been disasterous in some cases (I'm thinking about missile elevator
:motors - our officers had no sense of humor about pressing the "up"
:button, and having a few tons of nuclear material go "down"). Fractional
:horsepower motors may be wired in a more forgiving manner. See an
:electrician to be sure.
:
: 73, de N1RUI Jim

Jim..

Definitely.. I would have a big problem if I left the 220 stuff
connected. That is why I said to disconnect all 220 stuff.. I "unhook"
everything that is 220... I DON'T know what happens when you hook same
phase power to separate phased inputs.. (My instinct says that nothing
will happen.. both sides are at the same voltage.. It just won't work.
But there may be some circuits that use a center ground, i.e. both phases
to ground) I DON'T INTEND TO TRY!!!!

By the way.. I have tested my setup, about two years ago...

Jim

> includes 160meters. I have found a verticle by Sommers Antennas out of Geneva,
>Roger,

Take a look at the Gap antenna. Also, if you have room, it's hard to beat
an inverted vee on 160.

A friend (K4JKL used to have an Omni V es now has the FT-990. Loves it.
However, why buy a rig (in his case) that has been out longer than the
one you sell? I've got the Omni V myself. You'll have a hard time
beating the Omni V or VI for low noise reception (low phase noise, etc.).

The Omni VI has audio DSP; the others you mention do not. QST reviews
find something less than desireable about all the top Kenwood, Yaesu,
and Icom rigs. 73,
Larry, W3UIO

>compare with the Icom? I have heard mixed comments from locals and
>would appreciate some advice from this newsgroup to help with my
>decision.

It's a pretty good little radio, John, but it only does 10 watts
on 6m. The IC-706 does 100 watts on 6m. That could matter since
external amplifiers for 6m that only need 10 watts of drive look
suspiciously like bootleg CB amps to the FCC, and aren't available
from reputable sources.

100 watts is a good power level for 6m, but 10 watts is often a bit
too little. And of course you're getting an all-mode 2m rig thrown
in with the IC-706 that is missing from the DX-70T. Is that worth
$300? I think so.

Pure HF performance of the two radios is similar. Both have deficiencies
compared to larger rigs, but both are adequate for most uses. If you
are heavy into CW operating, the DX70T has better keying. OTOH, the
IC706 works better with Clover and PACTOR. Neither is a FT1000.

The 733 also has tons of intermod, better look for something else
with a detachable face. Yaesu and Standard have attractive radios
in this niche that don't squall and growl at you all the time.

2957. mobile hf antenna for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-18 00:00:00 UTC
From: wf3h@enter.net
Message-ID: <4v5n9n$qlp@news.enter.net>
Source record: 195760
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

I have a hustler mobile antenna complete with mount and 3 resonators for sale. resonators cover 10, 20, and 75 meters. XYL has ordered me to get lower profile antenna!

Have worked morocco from the george washington bridge (NYC) with this, so it works pretty well.

Asking $75 for all, plus shipping. Please call Bob, WF3H at 610 261 9137 or email wf3h@enter.net.

Thanks all.

2958. Re: ICOM IC-761 -- opinions, please.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-18 00:00:00 UTC
From: wf3h@enter.net
Message-ID: <4v5nfr$qlp@news.enter.net>
Source record: 195761

Well I upgraded last year from a 735 and am VERY pleased. Im a member of Frankford Radio Club (the highest scoring contest club in the universe...:)) and at our multi-multi station (K3ANS) many 761's are in use. Their quadruple conversion circuitry makes them VERY quiet.

On the downside they do seem prone to maintenance problems but this is probably reflective of the fact that they, like we, are getting older.

Price is in the range of 1100-1200 depending on options, etc.

We are trying to determine the interest in a plug-in
PC board that would send digital POCSAG, DCS, and analog
signals to service monitor mod input for pager/LMR testing.

We estimate the street price to be approx $299 USD
Please post or e-mail any suggestions or interest.
Thanks

>KA1FQT

Ten Tec has discontinued the Paragon effective this month. The new rig I assume is to replace it. Since they already have a line of amplifiers under the name Centaur, the new rig may be named as such. In any case, per a TenTech sales rep, the new unit wont be available till next year.

Hi,
I had mine modified. It opened up the RX and TX range in both 2meter and 440.
This is done with removing a couple surface mount diodes on the back board.
There is also a 800MHz mod that opens the receive range to include 800-900 and
some 600MHZ freqs. At present I dont really personally recommend it done
though. I had mine done as soon as I found someone to do it. I didnt know
anyone else at the time that had done it. It now lets me hear cellular calls
not only in the 800MHz band, but when I am in dual band mode, I get to hear the
harmonics on some of the 440 band. I'm not too thrilled with this.
I do have some notes on the mods if anyone would be interested.

I went the floorboard hole route in my F-150 Truck. I really had given up on finding a place in the firewall to route the cables. Then I checked around the heater core again, and I found a sopt that came out real high on the dash. If anyone is interestedin the relevance here, there is usually ALWAYS a place to send cable through the firewall. BTW, a local stereo shop may be a good source of this information especially if you have a vehicle that is a popular one to add large stereo components. The amps are almost always hooked directly to the battery either directly or via a dist. block.

2969. Wanted: Info on Yaesu FT101

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-19 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4v8st2$co6@pulp.ucs.ualberta.ca>
Source record: 195659

Hi,
Sorry if this is a repeat post, but I tried sending one earlier, and it doesn't seem to be out there, so here goes again. I recently picked up an old abondoned FT101 as a backup rig. Finals are OK, and everything operational except that on some of the bands the TX and RX frequencies are not aligned. The local Ham place will take care of that as I don't have the tools to do the job. Radio came with the SP101P speaker/phone patch, FV101 VFO, and YC601 digital display. I am wondering what the digital display would sell for separately? I am also interested in info on any mods. I am aware of the cap change with new finals, and the 30m mod. I have heard about the AGC mod, but do not have info on that. Any comments on the rig or mods would be appreciated. I know that these were used a lot on 11m, and this one seems to be no exception as it has the AM filter in the CW filter spot, and CB frequencies in the fixed channel position.
Thanks,
Chris VE6RDC

2975. Re: HF opinions requested for TEnTEn Omni 6 vs Yaesu FT-900/990 or ICOM 706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-19 00:00:00 UTC
From: rblank@txdirect.net
Message-ID: <4v94le$8ko@viper.txdirect.net>
Source record: 195665

I've got the FT-990 and an OMNI-V and I would have a real hard time selling either one! They both are great radios....the OMNI hears a bit better than the 990, but, the noise blanker on the 990 is better (at least on my samples, you understand)....I have a couple of remote switches that allow me to switch from rig to rig and also switch their audio to the Timewave DSP-59 for it's enhancement and to control the Alpha 76P, so, it is easy to get on the air reports for either rig.

Transmit audio goes to the Yaesu....I get almost as many comments on good audio with the 990 as I do with a KWM-380....different mikes on those two rigs, but using the same mike on the 990 or the OMNI, the 990 is said to sound more like me. The RF FSP speech processor is also less obnoxious to listeners than the TenTec processor.

The 990 is general coverage and is a better receiver for SWL'ing than an Icom R-71A is by far. The OMNI is ham bands only... The TenTec's receiver, though, is just a joy on quiet evenings DX'ing, it's amazing how much it hears....also, it hears the 10m downlinks from the Hamsats at a heck of a lot lower signal strengths than the 990 does...so much so that I quit using the R-71A to listen to the downlinks on RS-12 and use the OMNI for RX and the 990 for the 15m uplink Xmit (I can spot my signal on the bird this way)...I have a 10m horizontal loop above the roof that I use just for this...the recv ant switch is on the back of the OMNI-V and on the front of the OMNI-VI...

The OMNI VI has a built in DSP circuit, but, according to a buddy of mine who had an OMNI VI (and previously an OMNI-V) and now has another Japanese rig without DSP, the OMNI's DSP is not as good as the Timewave DSP-9+ that he uses now...he does voice, digital, and CW...

If you have anykind of a shortwave receiver at all (if you SWL, that is), then I suggest that you look into the OMNI-VI or perhaps even find yourself a good used OMNI-V and team it up with a Timewave DSP-599...great rigs all in all...

The GAP antennas are good performers, I have had a Challenger for several years and have really enjoyed it...160m, though, takes a lot of antenna and a great ground system to get good signal reports and is just a bit too much involved for me to try and get into with the limited real estate around my house! The Challenger is for 80 up and works great on 40, 20, and 15...10m is ok...

Good Luck!

Source record: 195668

SGC smartuners dont need a ground to work though its a good idea. When switching antennas you only need to re tune the tuner by feeding a few seconds of rf to it via key or voice.They can be fed several hundred feet from you rig if neccessary. They are not set up for ballanced output .The smartuner is the way to go.

From: ekv@panix.com
Message-ID: <4v9oe6$7t0@panix.com>
Source record: 195669

Greetings
I bought a Lafayette grid dip meter at a hamfest yesterday and need a copy
of the instruction book and schematic. Will reimburse for any expenses.

This meter comes with color coded coils and has a phone jack on the side for
audio. Its an AC unit and I pan to try to convert it to a battery and unit.
I don't have the model number on hand right now.

I would also like to learn exactly how to use it and what are the many
ways it can be used. I would like to start by measuring some coil
inductances and antenna resonant frequencys. Not sure of how to proceed.

Your help would be greatly appreciated.

I have a Heathkit Sixer (bought in 1974
used) that I would like to try to get
going again just for nostalgia.

Does anyone have a manual I could purchase
for a reasonable price?

Or is there any point? Does a low power
6-meter AM rig have any place on the band
these days? Any input on that would be nice
too.

Thanks alot to anyone who can help.

I don't know of a keystroke on the unit itself to remove a programmed memory,
but the programming software _does_ let you do this. It also has functions to
reorder existing memories and insert new memories.

Richard

I don't know if they have changed in the last few years but; the one I had in the back of my truck for four years just self distructed after Christmas. I found the inside PWB had charred from an Arch over. Things were comming lose inside. The mountng ears on the case cracked and fell off.

I liked the unit and used it consistantly for four years but I suggest looking at the ICOM units (AH-2 and AH-3).

I would be reluctant to pay over about $200. for a used one.

2999. Drake R4-C mods, filters, philosophy, etc.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-19 00:00:00 UTC
From: zyx@aracnet.com
Message-ID: <zyx-1908961937560001@ppp-h50.aracnet.com>
Source record: 195689
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I purchased a set of Drake twins this last weekend (R4-C with very low serial and beautiful T4X), which has rekindled my long love-affair with these radios.

The T4X is very pretty (no corrosion on copper chassis!) and evidently desirable, as I had offers immediately after purchasing it. I assume it, as with the T4X-C, works wonderfully, with no mods ever being needed (unless you don't have the wierd thin mic connectors :)
I got both hand-held and desk-top mics with the thin connectors in the deal.

The R4-C is a different story. It is in beautiful mechanical condition, having little of the telltale chassis corrosion; and the rotary switches had little oxidation. However, it had the Sherwood first IF 600hz filter and relays, along with the Sherwood audio amp and power supply mods.

I have owned a number of R4-C's in the past, but none of them were the low serial number versions with the MOSFET 2nd mixer and other differences.

WHAT I AM WONDERING IS IF ANYONE HAS ANY ARTICLES OR REFERENCES DESCRIBING THE EVOLUTION OF THE R4-C, OR COMPENDIUMS OF MODIFICATIONS TO THE R4-C OVER THE YEARS*

In return, I offer my philosophy on modifications to the R4-C, based on years of experience as an owner of high serial # radios:

1. Do not use the solid state tubes that were sold in the 70's. Measurements done years ago showed they greatly compromised dynamic range. Moreover, there are better ways of lowering power consumption.

2. The only mods needed to the audio amp and power supply circuits is the addition of a 5k pot in series with the 3.3k R76. Adjust the bias voltage across the 0.82ohm R86 to 0.2v, or lower if only headphones are used. This simultaneously lowers audio amp quiescent current and permits much cooler operation in the power supply regulator and transformer. Also, more headroom is available for the power supply regulator to operate, also, providing less hum.

Then in the audio amp a 0.0027uf cap is connected in parallel with the 22k R83 and a 0.1uf cap connected in parallel with the 0.005uf C101 to limit freq response and hiss. These values aren't cast in stone, and can be increased or decreased depending upon the operator's preference. Note: that unlike the Sherwood boards, these mods are easily undone if needed for sale to some finicky person.

(The radio I bought had the Sherwood audio amp. It suffered from very high hiss, which I could not get rid of by attempts to bandlimit the amp's response along the lines of the National Semi LM393 apps data. Those National Semi high power TO220 amps like the LM383 and LM1893 are notorious for oscillating at HF frequencies- in fact National spent most of its apps engineering time getting a pc board layout that didn't oscillate and then tried to get everyone to use it. Finally, in frustration, I reconected the original Drake circuit with superior results.)

For DXers who use headphones mostly, the original class A circuit works the best.

3. If for some reason, hum is intractable or you want to use an LM7812 monolithic regulator to power the R4-C, connect the +10V and +11V lines to the +12V bus, and remove R115, R68, C165, R116, R117, CR14, C168, CR18, and CR19. Thus 2 more sources of heat are removed from the power supply board. Also, C166 and C167 are connected together at the cap so that current flows from the rectifiers to the cap, and then back to the regulator. Also, the center tap for the full wave rect is removed from the chassis and rewired directly to the can of C166/C167.

Then, hum is non-existant.

4. The original diode product detector may be worth replacing with a stronger, more balanced design- but the answer is not an MC1496- I've tried it, and it doesn't work any better.

5. I have no info or experience with third mixer solid state mods. What do others know???

I am also looking for a good source of aux freq coverage crystals. If anyone knows of the best potential deals on these from major crystal manufacturers I would appreciate any info.

I have recently come across hundreds of very high quality 10pole 3khz linear phase and 5 pole 250hz linear phase 5.2mhz crystal filters. I am considering using these along with new carrier osc and premix crystals as new first IF filters. I am also interested in designing and using 16 pole crystal ladder filters in the R4-C. The radio has too much gain, so it shouldn't be too hard to utilize even CW bandwidth filters in the radio with crystals with Q of 150k or so.

I am also investigating replacing the first mixer in the R4-C with a DMOS commutating mixer, keeping V2 as a gain stage. An SD5002 would be used.

I hope I might have spurred some renewed interest in R4-C!!!!!!

James C. Marciniak wrote:
: If I understand your post, you are replacing a dual phase power source
:with a single phase power source, expecting that amperage is the only
:problem. I haven't worked with high voltage stuff for 20 years, but I
:would strongly suggest a meeting with an electrician.
:
:220V outlets in homes usually mean you have 208 VAC dual-phase power.
:This in turn means you have two 120 VAC lines, which are electrically
:120 degrees out of phase with one-another. The additional (third) phase
:brings you a full electrical 360 degrees of power.
:
: Usually, your dryer's electrical motor will be wired to take advantage
:of this phase difference, and you will either need to rewire the motor
:connections to work with single phase AC, or buy a completely different
:motor. Failure to do so may invite your dryer motor (and any other
:dual-phase devices in your home) to an unplanned cookout. Or cookin.
:
:There may be reasons you don't need to worry about this - since I've
:always wired 2 and 3 phase motors to 220 2 or 3 phase supplies, I really
:dunno what might happen, but I've seen rewind shops in the Navy arrange
:coils to use phase rotation to make the motor work - in fact, we used to
:have to check phasing with a phase rotation meter before bringing a
:motor back on line, if it had been rewired. Failure to do so would have
:been disasterous in some cases (I'm thinking about missile elevator
:motors - our officers had no sense of humor about pressing the "up"
:button, and having a few tons of nuclear material go "down"). Fractional
:horsepower motors may be wired in a more forgiving manner. See an
:electrician to be sure.

Industrial and commercial wiring is usually multi-phase, but individual
residences in the US are wired single phase. What people really mean
when they say 2-phase power is that they have *single* phase 220 VAC
fed from a distribution transformer with a center tap. That yields
two hots and a "neutral" at the entrance panel. You get 220 VAC between
the hots, and 110 VAC between either hot and the neutral. This is *not*
what an electrician means when he speaks of multi-phase power. Technically,
this is called "grounded 3-wire 1-phase" service. The center tap neutral
is grounded at the entrance panel. This is the normal "drop" feed coming
into a residence.

To get a 120 degree phase difference between legs, you need 3-phase
power in a delta or wye configuration. The utility will normally
supply you delta, and you'll have to make wye on premises with your
own transformer if you need 110 VAC. There's no such thing as 2-phase
power in utility distribution systems.

Normal 3-wire 3-phase delta won't give you 110 VAC without an additional transformer. You can use "Red Leg" delta where one of the phases is split and center tap grounded. That becomes your neutral, and you can get 120 VAC between it and either of the "hots" on the *same phase*. This is called grounded 4-wire 3-phase red leg delta. (it's an ugly abortion which can't be balanced.) Typically, you'd use a grounded 4-wire 3-phase wye connection instead if you wanted 120 VAC. This always mandates an on-premises transformer to do the delta-wye transformation.

Any 110 VAC branch feeder must have one leg neutral and one leg hot, and you can only get that with a grounded service. Higher voltage circuits are balanced with respect to ground, IE the legs feeding branches are all "hot". They can be single or multi-phase depending on the utility distribution available. In residential areas, the only distribution typically available is single phase. In industrial and commercial zoning, the distribution is typically 3-phase.

If you don't have an on-premises transformer and you can still get 110 VAC power, you don't have a 3-phase service (unless it's that abortion red leg delta, and any utility which still permits that ought to be shot).

Ok, what does this mean for the fellow with a 110 VAC generator? He could feed both "hots" in his entrance panel with the "hot" from the generator and connect the generator neutral to entrance panel neutral. Provided the utility drop has been disconnected, this is "safe", but no 220 VAC appliance will work. Now a person *could* do this, but he *shouldn't* do it.

The *correct* way to do it is to take the 220 VAC output of the generator, connect both "hots" to their respective legs in the entrance panel *through an approved transfer switch*, and connect generator neutral to box neutral and thus to utility safety ground. (You don't ever switch safety grounds.) If the generator isn't large enough to run the whole house, he can then use the entrance panel's branch circuit breakers to manage the load, either 220 or 110 VAC, as needed.

The worst that can happen with this setup is that you'll overload the generator and trip its breaker if you don't manage demand properly. With the other setup, if you don't do it exactly right, and in exactly the right order, you can kill someone, or destroy equipment, or start a fire. In an emergency you don't want to have to go through a NASA style checklist and countdown to make sure you're doing things right. (And the more dangerous time is usually when you are *restoring* to utility power. Get out of sequence there and watch your generator explode.) You want things wired so that they are as foolproof as possible, and so that if you're a damn fool, the worst you can do is pop a breaker.

If for some bizarre reason you're really on multi-phase power, let a professional handle it. Most "civilians" should avoid

monkeying with multi-phase power installations. You can easily
kill yourself or someone else if you don't know *exactly* what
you're doing and if you don't have accurate and *up to date*
wiring plans for the distribution. (I recently witnessed some
professionals creating big time arcs and sparks because they
were supplied with outdated wiring plans for the facility
they were remodeling. Because a real pro doesn't take chances,
they took precautions and weren't killed, but you could be.)

There's one piece of critical information missing from this thread.
PC power supplies regulate the 5V output. The 12V output is whatever it
is. For typical PC loads it all works out right.
If you try to run the 5V unloaded, there is not enough energy in the
core
to give full output on the 12V port.
So, you need a load resistor on the 5V output to make sure the 12V
supplies enough current for full load. You also need a load resistor
on the 12V output to insure it stays in regulation when the external
load
is off.

> Anybody have any experience with the Ten-Tec 6m kits? Pluses, minuses,
> and other opinions?
>
It's the best $95 I've spent on any ham gear... ever!! The manual is well layed out and reminiscent of Heathkit's manuals and the TenTec staff are very helpful. A friend of mine cracked a core on a variable inductor and they sent him one free of charge.

I finished mine in about 4 nights last winter. So far I have 52 grids worked and 27 confirmed. The only thing I could complain about is that it's not broad banded enough to use simultaneously on the FM and SSB portions of the band. I realize this is a design tradeoff but you can tune it for either 50 MHz or 54 MHz if you really want FM. That's the only minus I can throw out

3008. Collins 32S3 problem. Has anyone seen this problem before?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-19 00:00:00 UTC
From: Dan Newby <newbyd@omniview.com>
Message-ID: <3218D0D4.623F@omniview.com>
Source record: 195698

The other day I turned on my txmtr, tuned up and was getting full
output, but then switched to USB and when I keyed the mic, again I
got a full output carrier. This also turned out to be the case on LSB
and all bands. But then the output fell off to only a couple watts
along with the plate current dropping off in any mode or band.
All the power supply voltages are correct, I even checked them at the
finals. I still see a dip in plate current at resonance but it is barely
above idle current, approx 100ma. And when I tune out of resonance the
plate current can still go up to normal levels of 200-300 ma. I have
replaced the finals with a known good pair and it acts the same.

I'm thinking something has happened in the balance modulator, first
it was unbalenced then something actually let go so that now I get
very little output from it.
What do you think? Has anyone had this problem with the 32S3 before?

Thanks in advance for your help.

I thought I'd post this e-mail reply I received for the enjoyment of all. It seems one Mr. Lee Allen has nothing better to to then monitor this sig and threaten people. Here's is e-mail to me inreguard to Z1A mods requiest info:

>Subject: Re: Mods for Icom Z1A... Are there any??
>From: n5kxi@ionet.net (Lee Allen)
>Organization: IONet
>Date: Sun, 18 Aug 96 23:07:13 PST
>References: <4unni7$7mk@nntp4.u.washington.edu> <4us3bc$2dn@tron.sci.fi>
<4v641c$1li@news0-alterdial.uu.net>

>Your note is being forwarded to the FCC office in Dallas. Illegal Mods
>for cellular or out of band transmit will not go unnoticed

So at least for the moment, this self-appointed ruler has stiffled your right to freedom of information. He has single handedly tried and convicted me of broadcasting outside the ham freq without a single shred of proof. And for the record, I have never broadcasted outside the FCC sanctioned Ham radio bands.
At the moment, I wont reply to anyone requesting the mod information. If your not happy with my decision, let Mr. Lee know about it and duly take the credit.Congratulations Mr. Lee, you've destroyed the Constitution and denied me and others our rights to freedom of speech and freedom of information that would be guaranteed us under the Constitution. You have done what Congress failed too.

???

An *AC* generator *is* an alternator.

Note, even if what you ultimately want is *DC*, an alternator/rectifier combo is still more efficient than a generator, especially if the prime mover runs at variable speeds (IE like a car engine). That's because the critical slip angle for the brushes in a generator changes with speed. That's why all modern autos use alternators instead of generators.

From: burt lang <burt@rocler.qc.ca>
Message-ID: <321A34DF.5001@rocler.qc.ca>
Source record: 195580

The PK-80 was AEA's clone of the TAPR TNC-2. Still perfectly good for 1200 bps packet and is upgradable with add on modems for 9600. Virtually same as MFJ-1270. Suggest upgrading the firmware with latest TNC-2 or PacComm Tiny-2 firmware.

I have at least 4 of the PK-80s currently in service as TheNET nodes in our network.

Never heard of a PK-90. Might have been a commercial version. If it looks the same layout as the PK-80, try dropping the TNC-2 firmware into it and making sure that the modem is tuned to 1200/2200 freqs as per the TNC-2 calibration instructions.

Since these TNCs are approximately 10 years old, suggest checking the backup battery and reburning the state eprom. See article at

http://www.cam.org/~radio/halflife.html

for further details.

> mike_fallon@mon.bbc.co.ukMike....

Thanks for reminding me to go look...and finish a project...
Have a one page, poor photo-copy of the SM-8 schematic.
Checking against the IC735

Pin
1 Mic #1 **
2 +8 vdc
3 Up/dwn
4 nc ---- the IC735 shows something..labled "sqls" goes to the pl
board.. think part of up/down stuff.
5 Ptt
6 Gnd
7 Mic 2 **
8 nc --- IC 735 has Rx audio on pin 8

** I'm quite sure there's 8v on the Mic pins also...Will
check tonite.. the '735 has a jumper from it's pin 1 to 7,
so the SM-8 can be on 1 or 2.

GL....Bob - K2RK

Trade Collins KWM-2A transciever
32S-1 transmitter (have two)
75S-1 reciever (could use new trim ring)
75S-3B reciever
1 tube and 3 solid state power supplies
312B-4 station console
for later model ham gear. esp VHF/UHF/SHF, Amateur TV equipment, packet...
May consider HF gear, SSTV, Computer or musical instruments.
Would also consider trade for old (M-38, CJ-3...) jeep.

I am in the San Francisco Bay area.

Peace;

Kimmie

Um, this is yesterday's solution. Back in the dark ages of the internet (18 months ago) I used to use a book called the internet yellow pages. With the advent of the search engine (Alta vista, Lycos, Deja News etc...) it is easier and quicker to do an online search.

Good luck, I think you will need it.

I have a TH-79A(D) and it is a great radio. I have never had anything but extremely good service from their customer support and I highly recommend it just for that. The radio itself is very nice. I was looking at both the FT51 and the TH79 and chose the TH79 because it felt better in my hand and in my opinion it is more ergonomic. I liked the backlit keypad of the FT51 but once I got used to the placement of the keys on the TH79 I prefer it. I can use it at night and be completely invisible which is sometimes important. The other thing I like about it is the menu feature. I am very technically inclined but I cant remember all 70+ pages of the manual after some time and I find the menu comes in very handy for not often used functions. Otherwise the radio is very intuitive.

My wife has the TH28A and the two radios work together with so many features that we love. We also have the TM733 in the car and you can use the TH79 as a remote control for th TM733 and that is an incredibly cool feature. We dont use it much but it is cool. I have been very happy with Kenwood. Their products are rock solid with impressive performance and features. Their customer support is really, really good. A lost art in this age of obsolete when bought products. I can highly recommend the TH79A(D). I am not in any way associated with Kenwood except that I am a happy customer. If you would like to know more specifics about the radio you can email me.

3047. Need help with ICom706 Wideband mod

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-20 00:00:00 UTC
From: Chris@sublime.com
Message-ID: <Chris-2008962200550001@news.sirius.com>
Source record: 195601

This is after doing the normal D-59 mod...

For the wideband tx mod (1.8-200mhz) I have:

Remove Diode Q38 (under shield)
Remove Jumper R35 (under shield) - (really Resistor R35)
Both of these are next to IC36 under the shield.

Only problem the shield is pretty well stuck to the board. I removed the (6) solder connections and it still wont budge. Plus it looks as if at least some of the components under the shield are covered in epoxy.

Anyone perform this mod before? What else do I need to do in order to remove the shield?

Thanks
-Chris

I am the owner of a Ft50r, and am looking for a mag mount
antenna for my lease car..

The local store has 2 MFJs, one 19" for about $15
the other 29" for about $29.

Both are dual band..

Any one with experience care to comment before I buy?

I like the shorter one for styling reasons, and it looks
like a cell antenna...

But I am concerned about performance, also.

I do a lot of listening, and use the wide range capability of
the ft50r quite a bit..

thanks

3050. Generators-any ideas?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-20 00:00:00 UTC
From: Rick Tressler <aa8vq@netwalk.com>
Message-ID: <321A658E.1051@netwalk.com>
Source record: 195604

Most residential power comes into the home via 2 hot legs and a ground/neutral. Hot to hot is 240 volt (about)
and when referenced to the ground, aka neutral, (theyr're bonded back at the utilitie's transformer) you'll get
120 vac or so. Either way, it's all single phase power.

Be advised however, that if you plan to run a generator of ANY type in place of your service power feed, that
is the deafult power from the utility, you MUST isolate the incoming service entrance wires from the generator
feed. There have been actual cases where people have fed their service panels via the dryer outlet.
Convenient, yes? Definitely!! Does it meet NEC code? No. Further, if your power goes out and you crank up
the gen set and don't have the feeder isolated, you're also energizing the utility lines and everything
UPSTREAM!! Sooooo, that 13.5 kv transformer up the road is now being backfed from the little Honda gen set in
the basement.

I felt this was worth mentioning, because it's actually happened.

Hello Jim,

I am using that BD-35 for almost 6 months with my FT51R and I found it
is
very satifactory. With 5 watt input, I can get 50Watt on VHF and 35Watt
on UHF. Though it will getting a bit hot after 30mins of operations.

Source record: 195610

Hi,

I have a TM 241 A radio serial # 51103328.

The radio has been exhibiting erratic display's. The display sometimes is jumbled or partly legible or other times full of all the numbers and letters. Sometimes turning it on or off corrects the problem and sometimes not. The present operation or mode remains the same but I cannot change frequency or modes when this happens
This situation is intermittent and I cannot determine what causes it. Have examined the radio for loose connections but cannot duplicate the problem. Sometimes the radio operates normally for days.

A friend with a similar radio , ser # 50800237 experiences the same thing. Is there a Kenwood fix for this problem ?

Your comments would be appreciated

Thanks, Claude

>
> Does anyone have experience with the ADI Premier line of Mobile Radios?
> ADI AR-446 is the model of interest.

The ADI AR-446 has just recently cleared FCC type acceptance procedures, and Premier Communications is anxiously awaiting first delivery of quantities of radios.

With Las Vegas being very well known for its Intermod problems (every hotel on "The Strip" seems to have ten of their own transmitters, along with space rented for fifty more, on its roof), Dennis Dinga/N6DD, Sales Manager for Premier Communications, managed to get me a sample of the AR-446 to play with for a short period of time. I left my house (in the Northwest part of Las Vegas), went past "Downtown Casino Center", south down I-15 right alongside "The Strip" to Tropicana Avenue, then east to the other side of "The Strip" and up the other side, then made a tight circle around the "Casino Center" area. The other radio in the car (which shall remain nameless) was babbling away almost continuously ... but the AR-446 only "burped" a couple times during the whole trip.

The receiver in the AR-446, in my own opinion, based on this (very unscientific test) looks to be one of the best on the market - and, as you say, the "price is right!".

Be patient, and the radios will materialize ... best bet is to pick your favorite dealer and put in a backorder.

Thanks - and good luck!

Ulf Lange wrote:
>
> Does anyone know if here are any mod's for the Kenwood TM-255E

Mods for to do what ... if you want to modify the radio into its various elemental components, procure one pound of C-4 explosive, and take it and the radio out into the middle of a very large field ....

But if you are asking if you can modify the frequency coverage of the radio above and beyond what it was originally at, the answer is no. The TM-x55 series of radios was just what they were sold as from the factory. Since you have a European version, you MIGHT be able to replace the CPU with the American version, which would get you coverage 144.000-147.999, but that's it ... and I doubt that that mod would even work.

Very 73, and good luck!

> from reputable sources.

Actually, Mirage makes a 10 Watts in, 150 Watts out amplifier for six meters that has met with the approval of the FCC for years ... called the "A-1015G", and sells for about $350.00 ... they also have a 10 Watts in, 350 Watts out amp called the "A-1035G" ... but they don't make a 100 Watts in amplifier at all.

Tight shielding, quality bypassing caps (ie: 500pf + .1uf + >10uf, and
ferrite choke in line should kill most noise.

Be sure your power supply includes minimum load resistor. Some may not.
If not, under light loading the supply could fall out of regulation.
Before hooking to $$ equipment, check voltage at all expected loads.

What is it you are trying to do, Matt? The phone jack is an output port and will try to drive the tv/cd/tape player with its signal. Are you trying to record music from your stereo receiver onto the tape deck portion of your tv/cd/tape player?

I had a 757 that lost Rx and Tx on AM. I was told that it was
probably the AM filter or something in the AM filter switching.

That's all I know. The radio was sold without the AM section working.

>..

The worst problem with them is a very subtle one that few people know about. When you take a lightning hit that raises or spikes your AC inbound supply lines and your supply lines go through one of these surge protector deals, you can have BIG time problems!

All switching power supplies that ride behind these surge suppressors with the MOV varistor avalanche devices have the potential to knee up the ground reference leg by about a 1 to 4 ratio of the input spike! Thus a 6000 volt spike that is clamped to ground by the surge protector box suddenly becomes a 1250 volt pulse on the ground system of the device that is tied to the switching power supply!

That is how network cards, serial I/O and parallel cards and so on, as well as the ground foil lines to the phone jack stuff through external modems gets blasted to bits on computers that are tied both to switching supplies as well as to these common MOV surge suppressed boxes.

Linear power supply devices are not commonly prone to this unique failure mode described above! It's nice to have that $25,000 insurance policy they sell you with each of these wonderful surge jobs. The problem is, that if you really do take a hit, it is almost CERTAIN with one that you WILL have to use the guarantee!

If you use a switching power supply for a ham power supply, you are asking for exactly the same kind of failure mode here. Worse, since you are usually not really well protected from an antenna standpoint, the use of switching power supplies for ham gear is a double disaster just waiting to blow your nice ham gear all to hades during even near misses.

I gave up using ordinary computers with switching supplies in ham gear or commercial radio installations a long time ago. I blew up virtually every computer that ever was involved in one during hits prior to that time. Since going to the Integrand Research industrial cases with the nice big old 40 pound pig iron linear supplies and isolation transformers, I have never (knock on wood), ever had a failure in the sites since.....

> ecregger@water.waterw.com

If you notice, he said PHONO jack, NOT PHONE jack. The phono jacks are typically of the RCA type, and are indeed input ports. However, they are designed to accept a very low level input, like from a magnetic or ceramic phono cartridge. If a high level device such as the preamp outputs from a tape deck were fed into these ports, the signal would most likely be very distorted, at best.

Such high level devices are more typically connected to either the AUX inputs, or the Tape Monitor Inputs, if the receiver is so equiped.

I am looking for some simple answer re. the VX-10 that the dealer's I've talked with cannot seem to answer:

1. Can the VX-10 450 - 485 version can be tuned down into the Ham band?
2. Can the VX-10 be programmed via the ADMS software? If not, is the software available to individuals?
3. Can the VX-10 150 - 163 version also be tuned or programmed into the Ham band?

Any info would be GREAT!

: > Anybody have any experience with the Ten-Tec 6m kits? Pluses, minuses,
: > and other opinions?

: It's the best $95 I've spent on any ham gear... ever!! The manual is wello

Seconded!! Very good product, excellent staff, flawless manual (well
once you put in all the correctionsi :) I assume we're talking about
the 1208/1209 transverters here. Now I have a 2M/6M allmode, fun!

: I finished mine in about 4 nights last winter. So far I have 52 grids
: worked and 27 confirmed. The only thing I could complain about is that

I did mine in a marathon 12 hours session last night. Worked the
first time! I did have to rewind the first coil (got it backwards)
but they did warn me in the manual. The build a section, test a
setion philosphy really works, and lets you know you not far off the
mark before it's to late to correct easily.

You can build test and align it with very little equipment, but it is
much easier if you have test equipment. I think it would work well
if you set it up using only a HF or FM radio, but to optimize it you do
need a few things on the test bench.

I'll give you the same advice and Extra gave me, BUY IT, BUY IT, BUY
IT !! Gotta say he was right, you won't be disappointed. Hmm...
Guess I didn't have anything bad to say about it, oh well. Now
if I can just hold out until November for the 220 FM kits to be
released... (hint: Ask about the Model 1230)

:
: Both are dual band..
:
: Any one with experience care to comment before I buy?

Joel,

I have the same exact setup you are describing. The ft-50r with the 19" MFJ dual band antenna. It works great for me and I use the wide receive a lot myself also. Some gain over the duck, but it makes a big difference on your signal out. No rf bouncing around inside the cab.

I also occasionally connect the MFJ to my BC3000xlt scanner and it works great with it also.

My only complaint is all the connectors to make the ant. work with the ft-50. For those of you not familiar with the 50...it has a sma adapter for the antenna. Anybody know of a source to get an adapter to make a cable? I checked out radio shack, but no luck.

You can get the MFJ antenna from HRO for $14.95. Let me know if you need a number.

Source record: 195428

>I recently put out a posting looking for 6 meter gear, and almost
>everyone who replied said the TenTec transverter is the best
>way to go for the money. It sure sounds like it. But I have
>a few questions maybe some one can answer:
>
>1. I use a TS820S. Is the transverter output plug-and-play with the
> TenTec unit? or do I still need to run off the main SO239 and crank
> the power down to 5 watts.

There's only ONE SO-239 on the xverter for an HF rig.

>2. How is the performance, with say a 3 element yagi of the homebrew
> variety?

Dunno, I know of someone who's used it with a pretty good sized antenna
with reasonably good results. I use mine with dipoles and loops.

>3. How does the frequency read out? I assume I would shoot 10 meters in
> and use some sort of table to convert 10m to 6m, using the 500khz
> scale to keep track of the actual 1khz freq. Is this how it works?

Actually, it runs from 20 meters to 6 meters. For some, this may seem weird, but
in actuality, it is NOT weird:

1) 14-18 MHz becomes 50-54 MHz. While the manufacturer says you shouldn't use
it for transmitting above 52 MHz, you can certainly receive above 52 MHz
with it (can't guarantee FCC compliance when used for xmit > 52 MHz)

2) MANY general coverage rigs can transmit as well as receive from 14-18 MHz.

3) Transverters using a 10m IF use 28 - 30 MHz; this requirese either
two sets of xtals in the transverter OR a radio that works from 28-32 MHz
in order to get the full coverage.

4) There are MANY more 20m QRP rigs than 10m QRP rigs.

>4. How tricky is the kit to build and get going? I built converters
> years ago (tube days) and they were quite simple. Is the TenTec
> along those lines, or is it fussy?

The board is nice and clean, holes are plated through. The manual is
excellently illustrated and very well written. Mine blew a transistor
because I put it in backwards (had it facing the wrong coil, oops).

I called up the factory and they sent me a new transistor, free of chg.

>5. I assume, by the name Transverter, that this is a receive converter
> as well. Is this true?

Yes. Complete receive/xmit conversion.

>6. What is your overall opinion?

Wonderful kit, beautifully and ruggedly designed.

The unit can be set up to operate on anything between
0.25 and 10 watts input by changing a resistor.

The unit is RF-switched. This may pose a problem for some folks
because the first syllables may be dropped. The unit CAN be
wired for hard-keying, which a lot of people recommend strongly.

6m noise is often fairly high, and 6m signals tend to sometimes
wipe out commercial (poorly shielded) electronics. Take the time to
ground, if possible, and remember that while the unit can listen
to 49 MHz stuff, you should only listen to your OWN cordless phone.

Don't expect to hear much on 6 most of the time. When there's a
band opening, you'll know it. CW beacons will be booming in below
50.080, and there will be lots of stuff above 50.125.

PLEASE remember that 50.100-50.125 IS THE DX WINDOW. Please do not
operate in this band unless you're working DX.

Also remember that 50.125 is a CALLING frequency. When the band
is open, call there, make a contact, and QSY up the band.

Most of all, have some fun. You get the IF strip of the HF rig, a
and can work a new band for next-to-nothing.

I'm in the process of building an interface for my TS-690SAT. In the
article I am using, Feb 93 QST. p40, it states "Some other radios,
such as the TS-940S, require an interface board available from
Kenwood"

The artice provides schematics for building the interface, but from
what I read, the TS-940 need a board available only from KenWood.

Hello,

Does any one know how to route a 12 volt cable through the firewall
of a 1993 Dodge Spirit. I currently have my FT-8000 wired to the
fusebox and would like to wire it directly to the battery.

Thanks for any suggestions.

From: Adam <ads@zipnet.net>
Message-ID: <321B751B.575D@zipnet.net>
Source record: 195432

Hi All,

I just purchased a new Alinco DJ-F1T 2m HT. I REALLY like this radio, and I'd like to share my experiences. First, I got a great deal on it, only $188 from HRO. Secondly, the receiver sensitivity is one of the best on the market, and it shows. Thirdly, one big problem with HT's these days is that they get too damn hot. The way the battery fits on the back of the radio allows for long QSO's without the thing warming up. I performed the AM receive mods, and I have enjoyed listening to aircraft from nearby Logan Airport. This has got to be the best HT I've ever used, and I've owned many types. If someone is looking for an HT, check this one out!!!

Good luck

Sorry, I can't see a way to set the offset in less than 50 KHz steps. I tried through the radio's SHFT -07-, and with the ARMS-1C SW, and neither will let me.

Mabye if you repeatedly dropped your HT untill it was out of tune ??? (it was under warranty right? ... right?)

3101. solid state tubes for Drake R4-C, others

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: zyx@aracnet.com
Message-ID: <zyx-2108961904220001@ppp-h2.aracnet.com>
Source record: 195436

The original article in QST by Sartori describes the design proceedure for making solid state tubes. It is in April 77, pp. 45-50; with a follow up article in Sept 77 QST pp. 38-39.

Little was published later as evidently you can't sell many solid state tubes if everyone is making their own :)

Evidently, the main design objectives were to solve potentially future scarcities in tubes and to reduct power consumption in equipment.

It appears that the last goal was met as I remember my own Sartori "tubes" ran cool to the touch. However, in light of revelations in the last 15 years about IMD, I would be interested in seeing some new numbers of dynamic range on equipment with and without the solid state tubes.

(However, since my R4-C has 80 db 3rd order DR on 20m at 10khz spacing with Sherwood filters, I doubt it could get any worse!!)

Certainly, IMD resistance is proportional to standing current in the device. In light of the very cool running of the solid state "tubes" compared to the hot operation of the real thing, standing current in the solid state devices much be much, much lower. With 150v going into the tube, it just isn't reasonable to have 50-100ma flowing thru some semiconductor device without a huge heat sink. We know that those current levels are whats needed for high DR operation in single ended amps like those in the Drake.

I've had one for only about one week and it seems to work fine with
my TH-78. And I must say it looks very pretty too. It gets *very*
hot, so you get a free barbeque thrown in. I paid $189 from New
England HRO, and with free UPS thrown in. I'm 3,000 from my
instruments so I don't know what output I'm getting. If you need to
know, I'll tell you after Labor Day.

I see you posted a similar question in r.r.a.m. Perhaps you could
check out cross-posting to avoid multiple disconnected threads.

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment,rec.radio.swap

I am probably off my nut thinking I'll find something, but
I am looking for:

Any reasonable quality 6 meter rig, of
almost any vintage that has a decent
receiver and 20 to 50 watts out or so
on CW and maybe SSB. Tube stuff is
fine if it works and can ship. Digital
and FM I probably can't afford.

Let me know if I'm nuts, or if you have
something that sounds like the above.

ps - Dumb question: back when I was active,
there was in fact CW and SSB on 6meters. I
used to work it on the sporadic DX openings.
Is that still the case? Or is everyone on
just FM now? I know, dumb question! I used
to have a Utica 650 and a Swan 250.

3117. Opinions of TenTec 6-meter transverter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: zommbee@nwlink.com
Message-ID: <4vfkth$4qn@texas.nwlink.com>
Source record: 195539
Cross-posted to: rec.radio.swap,rec.radio.amateur.misc,rec.radio.amateur.equipment

I recently put out a posting looking for 6 meter gear, and almost
everyone who replied said the TenTec transverter is the best
way to go for the money. It sure sounds like it. But I have
a few questions maybe some one can answer:

1. I use a TS820S. Is the transverter output plug-and-play with the
TenTec unit? or do I still need to run off the main SO239 and crank
the power down to 5 watts.

2. How is the performance, with say a 3 element yagi of the homebrew
variety?

3. How does the frequency read out? I assume I would shoot 10 meters in
and use some sort of table to convert 10m to 6m, using the 500khz
scale to keep track of the actual 1khz freq. Is this how it works?

4. How tricky is the kit to build and get going? I built converters
years ago (tube days) and they were quite simple. Is the TenTec
along those lines, or is it fussy?

5. I assume, by the name Transverter, that this is a receive converter
as well. Is this true?

6. What is your overall opinion?

I hope I haven't asked too much! I don't have alot to spend on gear and want
to make sure I spend it wisely. There's nothing better than the internet
for getting opinions (whether you want to or not!!), and I often base
buy decisions on what I hear in these groups.

3119. Re: Phono to CD/AUX on Stereo?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: Dave Sumner <dsumner@ctaz.com>
Message-ID: <01bb8f18$322fc880$25a355ce@dsumner.rtilink.com>
Source record: 195541

I hate to disagree, but the "phono" jacks on a stereo receiver are inputs! I believe what Matt is trying to accomplish is to use the phono (short for 'phonograph', btw...what's that?) inputs as another "aux" input for additional audio signals from TV or CD. This is not hard to accomplish, although the signal level from the device being input may need attenuation or preamplification to match the gain of the "phono" inputs, which are generally very high-gain in nature to compensate for the low output of a phonograph cartridge. Also, if the aux input source is monaural ('mono'), the output of the device will need to be "y'ed", or split, to the left and right phono inputs to be heard on both channels.

I recently acquired a TS-940. I am interested to setup my computer
to talk to it. Looking through it's instruction manual only gives
me the idea of using ACC1. Further investigation with the schematics
yields the pinout for ACC1.

If I remember correctly, this is a RS-232 port that uses 5V instead
of +/-12V. I can deal with that. But do I need to install anymore
IC in my 940? What about the software commands? Any suggestions?

assembled units for 6 meters up to 10gig at reasonable prices & extremely
good performance. Their kits are not for the 1st time builder though. I
use one of their 432 & 1296 transverters here.

3124. FS: Icom IC-W21AT Dual Band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: ZIPNET <lisa@zipnet.ent>
Message-ID: <321B7275.7F44@juno.com>
Source record: 195546
Cross-posted to: rec.radio.swap;,rec.radio.amateur.equipment

I have for sale an Icom W21AT dual bander. It is in very good condition, and I have all the original box, manuals, etc. It is capable of full 800MHz receive, and 50-300. 300-500 as well with good sensitivity. Also has full duplex cross band repeater built in. I am asking $260 firm. This is the best price you can get on an HT of this sophistication and condition, trust me -- you'll love it. I really have no use for the 440 side, and I would like to get a 2 meter only HT. Please respond to:
adamn1qbk@juno.com or call (508) 881-5070 before 10:30 eastern. You pay shipping.

Thanks, and 73

3126. IC-706 operating voltage ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: hduff@icacomp.com
Message-ID: <4vfs8v$o72@master.ftn.net>
Source record: 195548

My IC-706 has been experiencing a problem in that it shuts off (or appears to) occassionally after I go to transmit...sometimes it comes back on shortly after...sometimes it won't come back on for 5 minutes or so. I was thinking that it may be sensitive to low voltage since I had a problem with the alternator in the car and had to replaced it. The problem still exists even after replacing the alternator. I'm wondering if I still have electrical problems in the car since the radio works fine in the house yet it is still cutting out in the car. I have placed a DVM across the DC connector of the 706 in the car. The last time it did its thing (cut out) the voltage was about 12.10v which I would expect to be okay for the 706.
IS this baby that voltage sensitive that it wants to see 13.8 or more or am I experiencing some other strange problem ?

Thanks...Hugh Duff VA3TO Toronto

3127. Palomar/Texas Star Mobile Amps

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: LAXX43A@prodigy.com
Message-ID: <4vep71$jne@usenetp1.news.prodigy.com>
Source record: 195549

Does anyone know anything about the Palomar mobile amps listed in the
Amateur Radio Trader?
They are 10 thru 80 meters and are cheap.
the outfit that listed the amps is Associated 18003590050.
The prices are pretty attractive, but like most deals that are attractive,
they may be too good to be true. Has anyone used one or know someone who
has used one? Are they clean? Can I run one without worrying about wiping
out my car's computer. Any special hookup required?
Do they work? Clean signal output or harmonic generators?
Anyway, if you can share any info, appreciate it.

3128. 706 2m Low RX: Follow up

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-21 00:00:00 UTC
From: brunner@mindspring.com
Message-ID: <4vg1t4$1848@mule2.mindspring.com>
Source record: 195550

Well, last time I posted about my 706 2 meter RX problem I got a lot of replies. Most said it is a diode that blows when you transmit on HF with the 2 meter ant too close.
The dealer I bought this used radio from contacted Icom and they faxed a fix. I was a rough diagram of a protection diode that acts like a fuse. Since my radio has been moded it has had 2 diodes added near the bad one is. I still haven't fixed it. Just got a HF ant on my car and I'm running it mobile. I had 2meters/70 CM all ready in the car anyway.

This last saturday I went to the Huntsville Hamfest. One of the reasons for going was to talk to an Icom rep in person. I wound up with a bad taste for Icom support. This guy told me he had never heard of this problem and that the 2 meter RX is turned off when you transmit on HF so it could not hurt the radio. I told him about the multiple responses on this newsgroup and he more or less told me that people here just make things up! He was a real jerk.
I just wanted everyone here to know how Icom feels about us.

Someday I'll fix the radio but it works fine on HF now.

Ben WD4MNI

From: Jim <jstrohm@texas.net>
Message-ID: <4vfup8$bv1@newsgate.sps.mot.com>
Source record: 195552

If those are the same as the Texas Star amps that have been available over the last several years, you get what you pay for -- a cheap CB amp. They're Class C, biased pretty hard, but not the junkiest CB amplifier you can get by any means. The last one I looked inside had four Morotola RF FETs and would actually provide 600 W PEP with a stiff power supply (diesel truck battery). G-10 board, decent quality components, and a PC board layout that didn't make me bust out laughing. And the unlicensed owner of that amp had not yet managed to blow it up. He got trashy audio reports, but that was because he drove the amp with a trashy signal.

Oh, did I say "CB amp"? The FCC has a real big chip on its shoulder regarding these amps, beause they work FB with 4 watts on 11 meters AM. There's also the issue of spectral purity -- if you can't get type acceptance anyway, why worry about output filtering or RFI shielding? Probably hard to get warranty service, too...

If you put one of these in a real box, bypassed your power and control lines, and filtered the output, you might have an amp that would be ham-legal (aside from the 11 meter issue). You won't know about your car computer until you try -- some can't stand having a walkie-talkie operated within 50 feet.

These amps are nice for portable operation, and you can always find SOMEBODY who will give good money for them, so if it makes your car die, you're not totally out of luck. Oh, and when you key down, be sure to rev up the motor. 600 W from one of these means about 100 amps draw from your battery.

N6OTQ (we all had to start somewhere)

Here's an easy way to get rid of a channel. You can mask a channel, and keep it out of sight until you copy a VFO over it. To mask a channel: select it (tap MR then dial around to the channel), press and hold FW for a half-second, then tap MR. The memory is now out of the channel list when spinning through the dial. (further on this is on page 31 of the FT-50R user's guide)

In Richard Parker's reply he suggests the ARMS software. I highly recomend it as an easy to use and understand interface to the radio.

PDNAUMANN wrote:

Must Sell ASAP: (No reasonable offer refused):
(3) Uniden FPS910TS 900 trunked HT. 9 System, 9 group 'brick' radio (rather large, a tiny bit more than the BC1/200 HT). Comes with 2 brand new batteries, 2 older batteries, 3 rapid chargers (not available anymore, hard to come by!!!) and 1 vinyl holster (no belt loop, just more for shipping/travel. $200/ each, or $475 for all 2. Invested much more into it. 2 currently programmed for TAC use.

(1) Johnson 9 channel 40?? (maybe 60) watt mobile. VHF. Was from Florida Sherriff or police which went to 800. Programmable by computer from Johnson Dealer. Must use external speaker (I can dig one out, standard 3.5mm plug), hand mike, and power cord included. GREAT radio. Scans, PL, everything. $250/bo.

(1)Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, Dual watch, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) (PLEASE don't ask how to do it, I was overrun by more questions on how to do it than offers to buy..)Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $280/BO.

WTB: Icom U-16, must be in good condition. Make offer, or trade for one of the above??

WTB: Yaesu VX-10 UHF.. Make offer, trade for ALL of the above?

All prices plus shipping + COD. I am NOT a company, just a collector of stuff I no longer need. <GRIN>

ALL PRICES NEGOT.! I need to sell, so give me an offer!

From: donn9ihw@aol.com
Message-ID: <4vgcd3$ie3@newsbf02.news.aol.com>
Source record: 195560

The TS940 needs an interface board model IF10B

Make sure you get the "B" model, not the "C", if you can find one. Most stores are out of the original manufacturing run. At hamfests they are as scarce as hen's teeth.

Kenwood last year made a limited number of IF10Bs, selling them only through
their own parts & service centers. I heard of someone was still able to get one from Kenwood just last month.

Good Luck 73's

Source record: 195438

Hello all. I just purchased the 212 on clearence and so far aside from the inability to store non-am. freqs. I don't regret the purchase.

I just entered what I thought were the search limits for the VFO, but what I did was to enter S1 and S2, the skip frequencies! How does one clear those? I tried the sequence that they say in the manual to clear a memory channel to no avail. Has anyone had this happen? For now I just put in bogus frequencies outside the search range.

Thanks for the help...

Jim in sunny Buffalo, NY.

hi joel, n4mrc here. i own both antennas and i have no complaints with them. when i bought the longer one and installed it a friend came by with his swr meter and we tested it(on 2m only) the swr was so flat you almost could'nt see the needle move. my overall experience with mfj has been that it ain't always the prettiest, nor the absolute best performer, but their gear usually works very well and is a good value. buy the longer one if you work alot of fringe areas, otherwise go for the short one.

From: Keithhat@apple.com
Message-ID: <Keithhat-2208960137270001@SantaAna01.news.internex.net>
Source record: 195442

Has anyone out there been able to get the ADMS-1c software running on a Mac under SoftWindows, and a Yaesu FT51R or 50R to work correctly? I have been trying to get it to work consistently and it doesn't. I am able to pull data from the radio and see what I have programed directly. If I edit and try to send back to the radio I get an instant error on the screen of the 51R which locks everything up. I bought two ADMS kits so I have tried a second Yaesu cable.Thanks in advance for any suggestions.

Hi,
I've noticed a recent spurt of "for sale" postings to
rec.radio.amateur.equipment. Just a friendly reminder
that this forum is for the general discussion of equipment

The correct forum for buying/selling/swapping is the
rec.radio.swap newsgroup.

not trying to be a netcop here, just a reader with lousy ISP
who cant carry many days worth of messages (the forsale posts
bump out the equipment discussion posts).

thanks.
Joe

3158. sick heath SB 303

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-22 00:00:00 UTC
From: Daniel_F._Stiles@inetgate.UShmm.ORG
Message-ID: <9607228407.AA840728004@inetgate.ushmm.org>
Source record: 195448

Hope group can help-

I have gotten a Heath SB-303 and 401 donated to
my childrens School Ham Club of which I am the
advisor.

Seems the radios were caught in a flood and were
dunked. They cleaned up nicely just a bit of a
dirty film over most. When power was carefully
reapplied. The following was noticed--the 50
Volts AC coming from what appears to be a bridge
rectifier made from discreete components is
working. Heath says you should have 35 VDC coming
off the main filter cap. I get 30. (suspect cap
is going south). The regulated 15 VDC is ok and
the bias adjusted properly.

I just recently moved and have very limited test
equipment (a single Digital volt meter) so
extensive testing is not possible. In addition,
my schematic is a copy and tough to read. It is a
copy supplied by a fellow ham and I appreciate his
efforts for without that I would have nothing.
Here are some of the symptoms---

No audio--audio section is working fine. I
injected a signal through a patch cord to the
input of the audio stage and it works fine.
Problem is detector or earlier.

Measured voltages on IF board and discovered the
following. Q504 2nd IF AMP-collector voltage too
high in operate mode-- OK in STBY.
Q503 IF AMP no emitter voltage either mode,
collector too high in STBY mode.

Mixer board the emitter on Q202 is 5 volts too
high.

PS BFO board no voltages at all on Q601 and Q602.

On the RF Amp. board Gate2 on the single device is
too high.

The bias is set correctly but swings considerably
when the RF gain is adjusted.

One symptom is seems to have although I can not hear to confirm is that when the AGC is off. The S-meter rests a "0". When the AGC is turned to "slow" the s meter goes to about half scale over the span of about 1 second. When it is turned to "fast" from the off position. It goes to half scale but almost instantly. I am wondering if a feed back loop is setting up with the difference in time being the different RC constant between the fast and slow settings.

Also, can anybody translate Heath part numbers on Transistors and other solid state devices into real world numbers so replacement parts can be obtained?

Any help would be greatly appreciated as I would like to get the rig fixed so the kids can use it. It won't be long before another bunch will be taking the exams. It was a good radio in it's time and can still be enjoyable to someone after I stop calling it bad names.

Oh and by the way, I assume it did work as it has a Heath factory service sticker on the chassis.

thanks,
Dan KB1BG

3160. Icom Tech-hepl!! W31A VCO UHF adjustment/test help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-22 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <199608220131.SAA20736@magor.comlab>
Source record: 195450

Anyone with an Icom W31A HT, I have one and the
PLL does not seem to lock with VCO properly. I
have a service Manual and thet say measure the ULV
voltage, it should be ~1 - 2 Volt range for the UHF
side, and adjusting it is with L2, (assume a coil)
you slightly spread or tighting the coupling by
moving the turns closer together.
The problem is that the radio inside has two stacked
boards and to even measure the ULV point, it it on the
board facing the back cover of the HT. The manual does
not show enough detail to show if ULV and L2 can be
by detaching the back cover.
Any Icom service tech that can give me a clue would
be appreciated. It seems the service manual just gives
the bare information to get by.
The top board and bottom board plug into each other,
and are tied together with a large ground strap. I don't
want to try this the brute force way, I rather get some
useful info to do more effectively.
If the VCO is bad then I will get a part for it or
send it back to Icom. The red xmit light goes out when I
tx on 449MHz, but ok at 445MHz. Want to check UHF VCO
ULV voltage test point.
Thanks
Mike Aust

Have been using a 706 mobile on a trial basis for about a week after long experience using the TS-50S and a 50W 2 meter rig in the car. If you need DC thru 2 meters in 1 box then 706 is obvious way to go. But the TS-50S receiver is head and shoulders above the 706 in a mobile environment. Problem is one) high level of inherent receiver background noise and two) susceptibility to induced noise from power lines and the like. Interestingly, there is no problem with ignition noise. Also, for my travels the 10W on 2 meters just isn't enough. One man's experience and opinion. Good luck with your choice. N2SS

: : ft-50. For those of you not familiar with the 50...it has a sma adapter
: : for the antenna. Anybody know of a source to get an adapter to make a
: : cable? I checked out radio shack, but no luck.
:
: You bet. HRO carries an SMA-BNC adapter for the FT-50r. Be sure to ask for
: the one for the FT-50, as they also carry one for the FT-10 that is
: threaded differently.
:
: The MFJ comes with a PL-259 to BNC adapter, so that's all you need.

Right, that is what I am doing now. That makes three connectors...the
cable has the PL-259, to the BNC to the SMA to the radio. The
conglomeration of adapters and connectors is bigger than the radio ;)

What I was hoping for was a SMA connector I could use to make a cable.
Thereby, bypassing all the connectors and adapters at the radio. That
would be much cleaner and easier.

Thanks for the input though...

I have used an R-5 for years. It is my favorite non-directional antenna,
bar none. Generally, if I could hear 'em, I could work 'em.

It is physically rugged. And generally the first time you put it up, all the
bands tune up with the SWRs advertised by Cushcraft. No taking it down
to tune it.

I love the R-5!

Due to differing antenna installation techniques, perhaps the best solution would be to conduct a field test of your particular installation. Drive to your normal camping ground. Connect the amp input to your radio. Connect the output to a suitable antenna, capable of handling the full output power of the amp. Then start the vehicle and run at a fast idle, to insure that the amp is getting full voltage. Then key the radio on your favorite repeater input frequency. If the car does die, or stall or go up in smoke, then you have tested the EMI tolerance of your vehicle. BTW when you key the radio on your repeater you might inform your ham buddies where to send the wrecker to pull you home. At the same time they can comment on how improved your signal is.

Good luck,

I hope I have the right group; I believe there were some postings a few weeks ago about the beauty of old TV's as sources of parts (such as to make an 80-meter 75w xmtr).

In any case, I have an old 19-inch TV available, free; RCA, using tubes (somethings that existed before transistors); I am guessing it is of vintage 1960's, maybe earlier. I presume it is B&W; it might even work but I did not try it. It was obtained from a summer cottage where for years it was used as the support stand for the "real" family TV.

This is for pickup only, in Bedford, Mass., very ASAP, before it goes to the dump. "The price is right", but speed is more important.

>in this niche that don't squall and growl at you all the time.

Gary,

I'm surprised to hear that my TM733A has all that intermod.
I live in the Los Angeles basin (AKA Intermod Hell) and don't
have a problem with it. I even use it with a high gain vertical
base antenna at times.

The only intermod I have heard on it is when I set both sides of
the radio to the 2 meter band. The side that normally does UHF
has an intermod problem on 2 meters. I don't do that much anyhow.

Intermod? Don't ask me about my Kenwood TH78A though.....:-(

Ahhh, sounds hauntingly familiar to my experience with ordering my Mirage 6m amplifier. I also waited many months with no explanation from my dealer of MFJ which now owns Mirage. A call to MFJ's sales rep gave a similar excuse: "We don't have enough trained assemblers."

Well I wasn't too enthused about a newbie making MY amp but held out. And it finally came "the day the 6m E season died", AFTER the last contest. The rep also informed me that they were waiting for the "lines" to finish making other equipment (not six meter). To this I asked if they are aware of the seasonal nature of propagation for six meters and that for most of us, a late summer 6m device will be mostly useless. She said they were aware, but made a decision based on other factors. She also promised that she would tag an outgoing amp specifiacally for me and that it would be shipped THAT day or the next. Arrival time to be the early next week. And you guessed it! It arrived two and a half weeks later.

Cosmetics are poor. construction is fair, components are low to acceptable grade. And I have yet to have the time to test for linearity/purity which is the most important factor.

That, and the fact that my MFJ dual digital local/UTC clocks diverge time at the rate of 2 minutes every three weeks (yes, new batteries) make me think I'll get my stuff from somewhere other than MFJ.

>Thanks in advance
>Tim,KC7QOM
About the only scanning type of mic that will work is the SM-8 desk mic. The
IC-730 uses a preamplified mic and the SM=8 will operate om either vintage
radios like the 730 or the newer ones like the 738.

3188. Icom-to-Computer Interface (Including IC-706)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-22 00:00:00 UTC
From: csmith1@ccgate.hac.com
Message-ID: <4vhsgi$dhs@newsroom.gsfc.nasa.gov>
Source record: 195478

This is response to the many requests for such info I've seen of late:

There are some shareware programs like LogEQF and commercial programs which support the Icom CI-V interface. I built a hardware interface kit from JBI (800-524-8658). This kit connects the serial PC port to the radio and includes several shareware programs at least 2 of which I got to work fine. (If the software doesn't explicitly include a 706 option, you can try the Icom 735 or comparable CI-V standard which worked in one case for me. The 706 set-up menu has port addressing selectable, so some combination/tinkering I found to work.)

The kit has EVERYTHING needed. You basically build a small circuit board into the 232 "D" shell (an isolator/driver) and connect it via the supplied shielded cable and 1/8" plug to the CI-V socket on the rig. You get freq. readout on the PC as well as mode (maybe one other parameter), depending on the software you use. I think some software will also get you control over the rig (at least mode & freq.)--I was thinking of trying AEA's Windows Log, but it's commercial at $49. (I haven't found any software that I liked very much, but am still in the market.) I think I paid around $30 for the JBI kit and was very pleased.

3189. Re: MFJ mag mount dual band ant, ques?

From: pchow@cisco.com
Message-ID: <4vi0ou$qev@cronkite.cisco.com>
Source record: 195479

I currently use the 19" version too.

For that kind of money, it's a great antenna. Well, almost anything is better than the rubber duckie anyway. But I do have two concerns.

First, the part that screw into the base which makes the contact is not "paint" free. I need to use my XACTO knife to scrap off the paint to make sure a good contact could be make.

Second, the mag mount is not very strong. So if you drive fast, you may end up with just a coax hanging in the free air. But for $14.95, it's kind of asking too much. Remember that a good mag mount by Larsen costs $30 or so.

I will probably use the MFJ until I save up some money and get a Larsen. But until then, I am having fun with my cheap MFJ.

You bet. HRO carries an SMA-BNC adapter for the FT-50r. Be sure to ask for the one for the FT-50, as they also carry one for the FT-10 that is threaded differently.

The MFJ comes with a PL-259 to BNC adapter, so that's all you need.

Message-ID: <321C97A7.32FA@ix.netcom.com>
Source record: 195482

I have over 300 feet of 7/8" hardline, one piece, w/o connectors for trade. I have no plans for using it at the present time. The hardline is about 6 years old, never installed and has been stored indoors.

Am willing to trade it for????? Would consider HF antennas, HF rig, test equipment, cash, etc. I have zero interest in VHF, packet stuff. Be creative - this stuff is collecting dust in my cellar. Would prefer trade in the New England area but could ship it.

Double good luck, I had one for about 3 months, looked like brand
new,took it to 5-6 big swap meets, and finally sold it for $375.00. It
did not have 10m, which means that a CB'er would have probably paid anoth
$50-75.

I agree 100%. I've owned my DJ-f1T(hp) for several years, and I have
never owned a better all-around performer in a handheld. Sensitivity
on the aircraft band is astounding, better than any of my three VHF
scanners (Cobra, Uniden, Realistic). Performance on 2m is superb,
with plenty of clean speaker audio, and excellent transmit audio. It
has enough "bells and whistles" to keep even a seasoned gadget freak
occupado for days on end, and many of these features are actually
useful! The construction quality is tops, and it has a great "feel"
to it... like it's built to last. I highly recommend this handheld!

pdnaumann@aol.com (PDNAUMANN) writes:

>Fine FT-50R owners - Does anyone know how to select a repeater TX offset
>frequency less than 50 KHz increments?

You need to set up a custom TX offset (i.e. you explicitly specify the
rx and tx frequencies)

Store the rx frequency.
Tune to the tx frequency
Press and hold the F key for 1/2 second until slot appears
Press and hold PTT while pressing the F key.

For more details see p. 26 of the manual.

> for this would be a great help; it IS for legal use.

Sorry, Andy ... I know that the U.S. hangliding association has a license for a channel(s) in the 151 MHz area, but that does -not- allow them to permit use of non-type-accepted radios on that channel, as many seem to believe. There is -no- way that any of the amateur equipment on the market (new or used) can be made -legally- usable on that (or any other) commercial/public safety/local gov't/etc. channel.

However, there are several models of commercially type-accepted equipment that can be programmed into the ham bands, and that is totally legal, since the amateur service does not require type accepted radios.

Good luck, and very 73!

-> Convenient, yes? Definitely!! Does it meet NEC code? No. Further,
-> if your p ower goes out and you crank up
-> the gen set and don't have the feeder isolated, you're also
-> energizing the util ity lines and everything
-> UPSTREAM!! Sooooo, that 13.5 kv transformer up the road is now being
-> backfed f rom the little Honda gen set in
-> the basement.

...and, if there's an unfortunate linesman upstream who believes the lines are dead and suddenly he grabs a "safe" cable......

We had a lot of generator users down here in south Alabama after hurricane OPAL caused massive power outages. The REA had several close calls with people who were unknowingly backfeeding from their generators. Luckily all went well and no one was hurt or killed. I did see one older guy with REA who I respect both personally and professionally really get bent out of shape over one generator hookup... ...there were 4 linesmen up the poles when they found out a commercial generator was down the road only about a mile. FWIW.

Source record: 195500

Thanks for the input Rich, I appreciate it. I've made a decision to
purchase a TenTec Paragon I I found for sale out here on the net. In the
long and short of it, for my first HF rig, I felt it would be a good
choice. I'm still undecided on an antenna though. I'm tossing about a
decision on a GAP Titan, Butternut HF9V-X, od a Sommers DCL280. Due to
lack of input from sommers, I may dicount them unless I either find
someone that has expirience with it or someone else sheds an opinion of
the data from their web page (www.sommerantennas.com).
The GAP, Butternut, or a Cushcraft I can get locally here. The Sommer
would have to be ordered from Florida.

But since this is my first attempt at HF, I guess I'll learn along the
way. Anyway, again thanks for the input.

3212. DEAD ICOM 706--HELP!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-22 00:00:00 UTC
From: kb2ufsmike@aol.com
Message-ID: <4viis4$cra@newsbf02.news.aol.com>
Source record: 195502

I have an Icom 706 that has worked flawlessly since I acquired it in March. Last night, however, when I pressed the on button--nothing happened! Actually, a relay clicked (RL2, I believe), the fan spun, and then the relay clicked again. There was not a flicker from the LCD or the speaker. Naturally I checked all of the fuses, including the circuitry fuse. I also verified the input voltage, right up to where the wires go into the PA board--13.8V. I do not have the schematics and have no idea where to start looking! The unit is still within the warranty period, but I don't know whether the warranty is still intact: I am the second owner, and the previos owner did the "yellow wire mod" and the MARS mod. Any suggestions would be *VERY* much appreciated!

I am wanting to build some dual band 2mtr/440mhz antennas by using 450 ohm ladder line and possibly in a j-pole configuration. i would like to enclose these antennas in either 3/4 inch or 1 inch pvc pipe to make them rigid and to weather proof them. i could put a cap on the top and would like to mount a so-239 in the base so a coax could be connected. does anyone have any plans or information on the dimentions , gain, swr, etc that could be achieved. also looking for any other ideas even if not with the ladder line as long as it would mount in the pvc pipe. please email me at tcmedlin@cris.com

Gary:

His application, i.e.: home power backup system, would not be a variable speed application, as these systems run at constant speed, with, or with out a load.

It has always been my understanding that a generator is better for handling
heavy current demands such as electric motor starting and other inductive
type loads, and an alternator is better suited for resistive type loads, such as lights.

I didn't catch the name of the original sender, but I have an HTX-212. Your problem dealt with how to clear the s1-s5 scan block frequencies. I discovered by accident that if you press shift when you are in the mode to set the s1 frequency, this will clear it. No, they don't tell you this in the manual, I just found out by accident. 73, Dave

From: "David E. Shelton"
Message-ID: <321D4403.4F81@iglou.com>
Source record: 195373

I have a small car, Nissan Sentra, that I run my IC-706 from. I have two antennas mounted the first a Larsen NMO 5/8 wave drilled thru the back of the trunk lid and an Outbacker Perth mounted off the driver's side rear end of the car. The setup is working fine now but I have read several posting that suggest this may not be the best setup for the two antennas. The Larsen 2M antenna is about 2 ft from the Outbacker Perth and so far no problems. I currently run primarily 40M and the 2M around town.

Any feedback is appreciated.

>>I was considering a R/S HTX-202, but have heard of a lot of folks
>>having trouble with them.

I have purchased two of them in the past two years - and not a single complaint. MOST of the problems you have seen/heard are NOT from newer production runs of the HTX-202.

A solid, reliable performed, indeed.

3234. Re: R5-Is this a good antenna?

>jkirk@dial.pipex.com
I have had an R-5 on my roof for about a year. The good news is that I
can work virtually everything I hear, and there were no SWR problems
when putting it up. The bad news is I don't hear alot of dx stations
that others with different antennas are working. I've also noticed
that there is no difference in results when I compare my R-5 on the
roof with my mobile antenna on my car. That comparison is what
probably made me most disappointed with the R-5. Since you already
have it, I would put up. But if I had to do it over again, I would get
a vertical with radials (Butternut seems to have a fan club in this
newsgroup.) Good luck...gus...wa6wbc

It really depends on where you are going to use it. The short one
works well if you are in easy range of the repeaters you plan on
using. It's an "in town" antenna. However, if you spend most of your
time driving in hilly or fringe areas, get a Larsen. When I'm out in
the boonies, I work repeaters with the Larsen that do not even break
squelch with the mfj shortie. gus..wa6wbc

3236. Unofficial "manual" for TH-59/89 HTs here

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-23 00:00:00 UTC
From: dave@hip-hop.hh.sbay.org
Message-ID: <4vjrpd$fe@moe.virtual.org>
Source record: 195380

A while back a friend of mine brought back from Akihabara
in Tokyo a couple Kenwood TH-59 1.2 GHz HTs, and a TH-89
430/1.2 HT.

Him, his wife and I pored over the Japanese manuals and I
wrote up a couple English "manuals" of my own. Just an organized
list of specs and explanations of what does what.

I have posted the manuals:

http://www.relay.net/~dave/th59.manual
http://www.relay.net/~dave/th89.manual

They are straight ASCII text files. Corrections are
invited if you spot any errors.

I also have a mod for the TH-89 that expands the RX range to
5 separate bands, including 800-960. This was supplied by Kenwood
Japan. I *don't* have an expanded TX mod for the TH-89 or any mods
at all for the TH-59 - Kenwood Japan said there aren't any. Luckily the
1260-1300 range of those radios is enough for US 1.2 repeater work.
Maybe Kenwood is not pulling my leg, but I don't want to believe
440-450 is locked out of my TH-89 forever... until then I'll keep
hoping :)

If you want the above mod, let me know and I'll type it in and
post it as well.

If you have any other mods for these radios, please do send
a pointer or post them here. Especially expanded TX for the TH-89!

73,

Dave KE6AJC
<dave@relay.net>

3237. Any info on Icom IC-701.

Source record: 195396

Tim,
Here is something to chew your fat on!
from 50 watts to 400 is 9 db or about 2 s units.
I dont know if you will notice that much difference while sitting the
trees... If I was wanting to get into a repeater from my camp site and the
mobile could not do it them I would look at putting up a good antenna.
You could get a 30 - 50 ft pust up mast
I would get a dual band diamond x500 antenna 2M and 70 CM
I would say erection time would take about 1 hr <antenna and mast work
that is > :-)
This might get you some height out of the trees
I believe that the diamond x500 has a gain rating of about 9dbd on 2
meters that will bring your 50watt mobile up to 400watt erp
cost would be about 180.00 for the antenna 50 for the mast
then you would need 75' of good coax and guy wire for the mast
so about three hundred dollars will get ya going..

Why a dual band
Well I have a alinco dual band mobile radio which also act as a cross
band repeater this way I can go hunting/hiking in the woods. and be
able to transmit from the ht to the to my crossband mobile on 440 then
to the 2M repeater

Works for me.... very well

Also 300 watts just inches from your head might not be to good of an Idea.
one last note...
if you do get the BIG amp then make sure your antenna will support the
higher power !

Good luck

>Jim.. WA5VPW..
>
I routed cables in my 84 Toyota Landcruiser and 1995 Dodge Ram. First, I used 12 gauge stranded wire for the leads. Next I looked on the firewall for a rubber grommet or gasket that had a cable (mechanical or electrical). Find one nearest the point of hook up on the interior and also on the side of the battery. Then take a stiff wire (yes, the ubiquitous coat hanger will work) tape the ends of the wires to it and poke it through the grommet or gasket from the engine side - usually the easiest. Find the end of the stiff wire and pull through into the passenger area - make sure you have enough wire to work with and get to your connection point. You may want to use cable ties or tape to keep the wire contained under the dash. If you are really paranoid, you can put tape over the wires where they go through the firewall to reduce the possibility of abrasion.

Carefully and neatly route the wires to the battery area. Make sure you avoid moving parts, hood closure, etc. I put fuses in both wires as I have seen recommended. Make the appropriate battery connections. I used crimp-on connectors and fastened them to the bolts on the battery cables. Again, use cable ties or tape to keep the cable secured.

Make sure the connector you use inside the passenger compartment does not leave the hot wire exposed when its disconnected from the radio.

So far these installations have survived a lot of off-road driving in all kinds of conditions. It's not really too hard.

3254. HTX-404 PL problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-23 00:00:00 UTC
From: Cedric Walker <Cedric.Walker@Tulane.edu>
Message-ID: <321DA92B.5B4A@Tulane.edu>
Source record: 195398

My HTX-404 works perfectly EXCEPT that it won't open repeaters that are CTCSS-only blocked. I can work non-PL repeaters easily. I've gone through all the programming and verification steps in the manual, and the display says it's transmitting PL tones.

Good news: I have extended warranty, took it to RS, it came back as completely checked out with no problem found. I even had the store manager verify that it is programmed to transmit PL tones.

Bad news: I tested against an FT-530 that has PL decode, and the FT-530 did not notice any transmitted PL tones. the HTX-404 still won't open PL-only repeaters, either. Conclusion: it still does not transmit PL tones, though everything else works fine.

Is this a "known" problem? I'd like to have a bit more ammunition in hand when I take it to RS for service again.

Thanks in advance!

3255. Ten-tec 2 meter amp

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-23 00:00:00 UTC
From: Jim Speck <speck@qns.com>
Message-ID: <01bb9122$bf6678a0$434357cc@speck.oklaosf.state.ok.us>
Source record: 195399

I built up a Ten-tec 2 meter amp kit, won at a hamfest. It works well; I use it on my bicycle with a RS 202 (on low-power) for an exciter, with a 1.2 amp/hour 12v gel-cel battery powering the amp. It has made a great deal of difference over using the 12v and high power on the HT barefoot, and I get about a week's worth of riding to work (14 miles/day) before having to recharge the HT and the gel-cel.

In building the kit, I found I was confused by the text several times, and there were a couple of places where a warning might have been in order - one such is the leads should be cut off within 1/16" of the back of the PC board or there is a danger of shorting to the heat-sink, once they are mated. The other confusing section concerned the class C vs. class AB connections, which upon study of the schematic and the board became clear enough. The coil winding instructions (final tank) which by its nature required (n + 1/2) turns was characterized by "ten turns". I used 10 1/2 rather than 9 1/2, and it worked.

Plus features are the small size (fits neatly on the rear rack of the bike) and low weight. It draws only micro-amps (in class C) when not transmitting, so it's left connected to the battery. All controls are on the HT (hi/low power, xmit, etc.) and if the amp's battery goes flat, the t/r relay in the amp leaves it out of the circuit.

>73.
>Mike W7CFL
>
Of all the amps of the caliber that you are talking about my
reccomendation is the Magnum brand of amps. They incorporate the
latest stripline tech. and modular construction. The 4 transistor
models (4000 using MRF-455's, 5000 using 2SC2290's, & 6000 using
2SC2879's) have the following features:

Continuously biased RF transistors via a fully adjustable, regulated
bias circuit. Voltage regulation, temperature compensation, current
limiting, and frequency compensated feed-back circuit. True class
AB-1.

Freq. Range: 1.8 - 30 MHz
Input VSWR: 1.5 to 1 or less
Amplifier Gain: 17 dB
IMD: -33dB
Harmonic Suppression: Better than -50 dB using the built in 5 pole
Chebyshev filter
Independent Pre-Amp Gain: 10 dB
Electronic Input Attenuator
Dual High/low inputs
Wrap around heatsink

Best of all they are priced lower than a Texas Star with the same
transistor setup. I have worked on them all and this one is
definitely the "cleanest". Whether or not it will get into your car's
computer or not is another question. I know several other amatuers
that use this amp from 80 to 10 and really seem to enjoy it. Hope
this helps.

Down East Microwave - 908-996-3584.
- Kits or asembled units for bands 50mhz thru 10ghz
- Weak signal VHF+ accessories and antennas
I have no connection other than being a satisfied customer.

Joe - AA3GN

Hi, I am looking for the following MICOR SYSTEMS-90 Modules or boards.

QLN 1917B Repeater Control Module
QLN 1918B Audio/Telemetry Multiplex Module
QLN 2042A Repeat Audio Processing (RAP) Module
QLN 1919C ECG Mobile Preamplifier-Modulator Module

If you have any of these I am interested in buying them from you.

Thanks,

Scott Sidener

I'd highly recommend Down East Microwave. They have quality
kits and factory-assembled transverters, for just about every band from
DC to Daylight.

Living on the north coast of California where we are accustom to power outages. (The last one was for more than one week.)

The first rule is to open the mains before starting the generator. Because 1) my generator will not power my neighbors and myself and 2) when the power is restored the generator will not become tost.

But you don't even have to make a circuit change - my HTX-202 does
a fantastic job on 9600bps packet just by using the appropriate taps.
Unless you count the hole I drilled in the case as a mod, of course. :-)

>Anybody know of useful mods for the RS htx 202?

There is the famous "duct tape" mod for extended receive on the
HTX-202.

1. Buy an HTX-202.
2. Buy a handheld scanner that covers "DC-to-daylight"..
3. Buy a roll of duct tape.
4. Place the HTX-202 and the scanner side by side.
5. Wrap duct tape around both HTs.

Now you have an HTX-202 with extended receive.

[I am posting this for a fellow Ham that has the problem. He does]
[not have access to Usenet but he has e-mail so please respond]
[to his address at the end of this message.]
==========

I have a problem with Yaesu FL-2100-B amplifier. When the
standby-operate switch is in the operate position, but listening,
received signals are greatly attenuated. An S7 sig is reduced to S1 or
2. Transmit operation seems normal. Examination of the TR Relay
reveals it is a sealed unit, preventing any spraying of contacts, if
indeed that is the problem.

I wonder if anyone out there has experienced a similar problem with
with a Yaesu or similar amps using 572B paired finals and similar
circuitry such as Heath SB series.

Also does anyone know where a replacement TR relay could be
obtained. Any help would be greatly appreciated.

3283. Help with high SWR

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-24 00:00:00 UTC
From: boblucas@netins.net
Message-ID: <4vlhg4$e11@insosf1.netins.net>
Source record: 195323

I am getting very high SWR readings... I have a TS690, going TO a 6M 175 w. brick, going to a MFJ tuner/wattmeter, to my antenna. When I just run the rig and the antenna, the SWR is minimal, when I put all that stuff in line, the SWR reading on the TS690 is sky high, yet the SWR on the output side, the meter next to the antenna, is low...

Why do I see such a high SWR at thge rig, and a low SWR on the antenna end? Am I explaining this right?

When all hooked up, the rig shows 10:1 sert, the final SWR show s 1.1//// help

Patrick, thanks for the help. [shift][rev] worked for me also. I guess because I was new to the rig (or the other way around) I was afraid to push buttons, but as the addage goes at work (computer network administration), "if you can't get it to work, just keep pressing buttons until it does!"

Again, thanks and 73.

Gary,

How about the YAESU FT-8500? And I see a picture of the 8500 in
my AES catalog that it comes with a MH-39 mike that looks to me like
it pretty much controls the radio from it. But what in heck is the
Smart Controller mike? It looks like a little overkill.

3288. Midland Syn-Tech question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-24 00:00:00 UTC
From: garym@cais.com
Message-ID: <321e5d46.148733@news2.cais.com>
Source record: 195328

I have a Midland Syn-Tech 70-056C and I am trying to find the
programming schem of the EPROM so that I can program it without having
to use Midland special programmer.

Any ideas?

Gary

: When all hooked up, the rig shows 10:1 sert, the final SWR show s
: 1.1//// help

Maybe you are adjusting the tuner incorrectly? What happens when the
tuner is connected up, but on direct - e.g. bypassing the tuner?

Can you tune up into the dummy load, with a good SWR? You should be able
to do so.

I have never had this problem, but have never tried to use a tuner on
antennas with less than a 2:1 mismatch.

Bill

3290. Any mods for the hw-5400?

3292. Drake "C" line backlash. A cure?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-24 00:00:00 UTC
From: scotgray@cwnet.COM
Message-ID: <321E704E.DAC@cwnet.com>
Source record: 195332

I have a mint Drake R4C receiver. Works Great. I also have a Drake TR-4 which I recently purchased at a swapfest. The TR-4 seems to have been built during the "B" line era; Tunning knob has the 1 KHz markings on the Dial Skirt. The "C" line has a concentric window still announcing a 1 KHz resolution. My question is about "backlash" or a tighter, less smoothing feel on the "C" line, wheras the R4, R4A, TR-4 and R4B have a much smoother feel. Is this normal for the "C"? Can it be fixed?

Also Looking for a AC-4 or AC-3 AC power supply.

Thanks!
Scott KD6CQ

>All of the Palomar, Texas Star, Boomer, Thunderbolt,
>Messenger, Silver Eagle, Shooting Star, etc. are advertised
>as Class AB-1.

Right, and I can make 500,000 a year buying HUD real estate with my credit card, and shampoo restores life to my hair....

AB1 indicates a tube amplifier NEVER draws grid current, and conducts for more than half and less than all of the signal cycle. The sub-script 1 is useless in a bipolar amp, since any bipolar amp that draws base current over the entire RF input cycle is class A, and any class AB amplifier does not draw base current over the entire RF input cycle is class AB, B, C or higher.

Right away that's a red flag telling us they are pulling data from their "rear sides".

Here's a good test for linearity. First, look at the bias circuit. If the bias circuit does NOT have a low dynamic impedance, changing base current will change bias. Good linearity in a high power solid state PA generally requires an active (regulated) bias source. A 100 ohm resistor feeding a shunt diode is NOT a good SSB bias system.

Next, drive the amp with a CW signal and watch the ratio of output power to drive power. If the ratio of drive to output power suddenly changes a large amount anywhere below any maximum power level you expect to use (say from zero to 100 watts), the amplifier is non-linear and will splatter. This isn't the best test, and it will miss some problems, but it's simple.

>Proposition: I have in my drawer a Deer Hunter 100, 100 watt
>linear for 3-30 MHz. am/fm/auto ssb;
>If a regular from this group would be willing to test &

>willing...

I can measure it here Doug, and return it. That's part of what I do for a living. Or you could do the simple gain compression test I outlined above.

>etc that could be achieved. also looking for any other ideas even if
>not with the ladder line as long as it would mount in the pvc pipe.

Count on the PVC detuning the antenna. It will change the electrical
length of the antenna by a factor determined by its dielectric constant
and the ratio of antenna element diameter (and internal position) to
pipe diameter. Using a flexible conductor inside the pipe could make
this an intractable problem to calculate. Cut and try may be the only
way. OTOH, using a rigid conductor fixed in position inside the pipe
would make the design amenable to calculation (and make it reproducible).

3296. FT50 ADMS bug

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-24 00:00:00 UTC
From: Joakim Gustafsson <joakim.gustafsson@comator.se>
Message-ID: <321E99F3.4C04@comator.se>
Source record: 195336

There must be a bug in the ADMS-1C software.
If You chose Wide FM or AM for receive mode in memory programming will it be changed to Narrow FM when You click OK. So fare I can see is there no way to program a memory position to anything else than Narrow FM using the ADMS-1C ver 1.01 or is there ?
My way is to program all memory frec offsets etc from the softw and after sending it to the FT50 manually select recv mode for each memory positon and resave each position that needs anything else than Narrow FM.
If You then reload the memory from FT50 to the PC will the new receive mode be there BUT !!!!!
Dont click OK after viewing the memory. Then will it be back to Narrow FM !!!!

Is RT system Inc and/or Yaesu aware of this bug?

3299. Zetron DID Converters (Model 50) For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-24 00:00:00 UTC
From: kgold@telerama.lm.com
Message-ID: <kgold-2408961204110001@kgold.slip.lm.com>
Source record: 195339

I have TWO Zetron Model 50 DID Telephone Trunk Converters for sale.

These both are in BRAND NEW CONDITION. They were in use for less than a year.

A DID (direct inward dial) line allows each mobile radio or pager to be reached at a unique, seven-digit telephone number, just as in cellular service. A caller doesn't have to overdial extra codes in order to reach a radio or pager.

They were designed to be used with a Zetron Model 45B (Z-Patch), 46 (Trunked Interconnect) or Model 48B (Repeater Manager) but will work with ANY DID installation.

Rack-mount. All manuals included.

This allows each subscriber to have his own unique telephone number!

Original price was $1,000 each. Willing to sell for $1200 for both or $700 each.

I Have one Zetron Model 810 Digital Hybrid fro sale. This is a 2-Wire to 4-wire converter with digital signal processing. It typically is used to connect a standard telephone line to a mobile radio system. It will enhance the audio (especially full-duplex) in trunking, conventional and cellular radio systems.

This unit is in excellent condition. It was in-service for less than a year.

Rack-mount. With Instructions.

Originally purchased for $900. Will sell for $600.

Bob,

Let's take this problem one step at a time.

FACT 1: SWR is okay between TS690 direct to antenna.
FACT 2: SWR is okay between Brick to antenna. (You don't indicate whether the MFJ tuner section is used or bypassed?)
FACT 3: SWR is high between TS690 and Brick.

Based on the facts as you stated them, there is a mismatch between the TS690 and the Brick. My guess is that the input to the brick is the source of the problem, since the TS690 output is okay direct to the antenna.

73,
W0MAY

>Thanks...Hugh Duff VA3TO Toronto

Hugh,

The normal operating range for an ICOM is 13.8 volts plus or minus 15 %,
Thats 11.73 to 15.87 volts. 0.250 volts may be to close.

Mike

That VCO is basically sealed, and you would most likely need to replace it.
OR ship it to ICOM if it is still under warranty.
The componete are mere fly specs on the VCO, the chip caps are about the size
if the push head on a straight pin.

Illegal to sell or advertise for sale. Violates FCC rules. May even (most likely) be illegal to operate since it oviously has never been properly certified.

>IMD: -33dB

Against what? What product? What reference? (Sounds like a number just thrown out from nowhere!)

>Independent Pre-Amp Gain: 10 dB

A pre-amp for HF Ham gear???

>Electronic Input Attenuator

What is it, PIN diodes? Is it variable? If it is not variable, why is it electronic?

>Dual High/low inputs

What the heck is that? High low impedance, high low frequency, or high low power?

>Wrap around heatsink

Cool :-) What does that mean?

This all sounds like CB jargon. Like putting saltwater in a jar for a ground. Just by the fact the terms are incorrect, it makes me suspect that this is just a sales pitch for another poorly designed illegal CB amp.

Who is the manufacturer, and where is their address? What is the FCC type acceptance number? If they openly break laws, how do we know they are honest with us on claims? If they have to hide, how do we get a warranty or service?

WWII semi-automatic key in good shape except Thumb knob broken/missing and name plate broken/half missing. With connector. S/N006317. Stamp on bottom says 1939 (I think, hard to read). First $20 + shipping takes it.

: A pre-amp for HF Ham gear???

Sure. Although, in ham gear, it is often called an RF Amp. For example, the
button on the Yaesu FT-757GX with that label.

There is even a commercial external preamp that works fairly well.

: This all sounds like CB jargon. Like putting saltwater in a jar for a
: ground. Just by the fact the terms are incorrect, it makes me suspect that
: this is just a sales pitch for another poorly designed illegal CB amp.

Most likely.

I read the very poor description about th FT-600 HF Transceiver at
yaesu.com.
Does anybody know more about this new transceiver i.e:
- FM narrow capability
- storing repeater shift for 10 m FM
- removable front panel
- size
- weight
- mods
.....
Thanky you for any comment.

I also bought one after reading this thread just to see how it is. It was picking up the engine noise that my Grant XL didn't. Guess it works for some, and useless for others.

: I would like to hear from those Hams using the Heathkit QRP rigs. How
: well do they perform? What mods are recommended to eliminate
: weaknesses? How well do they compare to the modern QRP kits?

I have an HW-8. For a simple QRP rig it works fine, but don't expect performance to be anywhere near that of a regular rig.

The HW-7 and HW-8 both have direct-conversion receivers. I found the reception of both sidebands to be relatively easy to deal with, but others complain about this. Hum is a problem with this type of receiver when operated off an ac supply. It's caused by common-mode coupling through the power supply leads and can be cured by wrapping the power supply cable around a ferrite toroid. The HW-9 has a superheterodyne receiver and will not have these quirks.

I had some TVI on my own TV when I lived in a fringe reception area. The filtering in the HW-8 is not very good (only 3 elements), though if you don't live in a fringe reception area it's probably adequate. The addition of a commercial low-pass filter corrected the TVI problem for me.

The HW-8 (and probably also the HW-7) have an audio output impedance of 1000 ohms, not the usual 8 ohms. I use 600 ohm headphones with mine and they work fine. If you use low-Z headphones you'll probably need to hook up an inexpensive audio transformer. I think the HW-9 has an 8 ohm output impedance, but I'm not sure.

I have no experience with the modern QRP kits, but from the prices I've seen, a used Heathkit is definitely easier on the wallet!

Gary,

" INTERMOD"

What about the Yaesu FT-8500? Im gonna buy either the Kenwood 733
or the Yaesu FT-8500 this coming weekend at the Shelby hamfest.
Also if I get the Yaesu, which mike should I get, the FC-10 or the
MH-39?

This also happened on mine, the display turned black. I had left the radio on,
Although it does not get as hot in Seattle, some days over 90 degrees. I never
had this happen until I left the radio powered up. it should return just fine.
No known cause or cure. You might consider mmounting the radio where direct
sun does not hit the display or cover it with a white cloth or reflective
material when not using it. It was several hours before the display returned.

The 15 Khz tuning step is a misprint in the manual, the radio never had that
tuning step.

This may help

Gary

Most Common Failures and Cures for the Icom IC-706

Symptom: Low RX sensitivity on 2-meters.
Probable Cause: Burned D6 on PA unit.
Cure: Replace D6 (MA862).

Symptom: No TX power output on an HF band.
Probable Cause: Bad filter relay.
Cure: Locate and replace faulty filter relay (will be type
AHY-103).

Symptom: Low/distorted RX audio.
Probable Cause: Burned foil trace on PLL unit.
Cure: Repair SPE (ground) foil trace on PLL unit.

Symptom: Low TX output on HF & 6-meters.
Probable Cause: Shorted D18 and Q1 in filter unit.
Cure: Replace D18 (DAP222) and Q1 (2SC4081).

Symptom: Inadequate mic gain.
Cure: Install field mod on main unit: Change value of
R236 from 27k, to 68k-82k. [The higher the resistor value,
the greater increase in mic gain.]

Symptom: Thin-sounding mic audio.
Cure: Install field mod inside HM-103: Remove rubber
gasket from beneath mic element.

Symptom: Off frequency in FM TX.
Probable Cause: FM VCO lock voltage needs adjustment.
Cure: Adjust FM VCO lock voltage for 1.5 volts as per
service manual.

Symptom: Unit is stuck in TX mode.
Probable Cause: Shorted T/R switch transistor.
Cure: Replace shorted Q32 in main unit.

Symptom: Radio won't power up. Possiably due to incorrect accessory
connections to radio by operator.
Probable Cause: Burned ground foil trace in flex cable.
Cure: Replace flex cable EP2 at main board.

I have both radios. The Kenwood is a nice looking radio and more
traditional with the knobs and buttons on the front but the Yaesu is by far
easier to use (yes the potato head mic is easy to use). The 733 DOES have
intermod problems as a result of a very sensitive and relatively wide
front-end. This is a well known problem and acknowledged by Kenwood.
Kenwood has added a fix to all the newer versions which amounts to an
attenuator to reduce the receiver sensitivity in the presence of strong
signals. If I were to buy a third radio which one would I get? The FT-8500
with no hesitation. I will gladly sell my Kenwood. It's about 6-8 mos old
but has only been used as a base station and has been disconnected for the
last few months.

"Storm Chaser" by Warren Faidley.

The critically acclaimed book is now in it's second printing!!!!

Stunning book includes 100 breathtaking, graphic severe weather photographs of tornadoes, lightning, hurricanes, supercell storms and hail. Also features adventure stories, easy to understand explanation of severe weather mechanics, graphics and extensive glossary. Published by The Weather Channel.

Complete data and sample photos at:

http://www.indirect.com/www/storm5/scbook.html

Or order directly at 1-800-544-6206
(A free catalog of weather videos, poster, etc. is also available at this number.)

Enjoy!

It would appear that the input stage to your brick is out of tune- this
is what the V.S.W.R. meter reads when the brick is being used. If you
are saying you have a hi V.S.W.R. even with the brick in bypass mode,
you may want to look at the cable connecting the 690 to the brick.

Just picked up an FT767GX and looks as though the battery backup is low.
The manual is of no help. Has anyone replaced the battery and if so
where is it and what is it?

Thanks. Dale WA2YPY

3342. "New" Ken. TH-79AD?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-25 00:00:00 UTC
From: Connie Hulst <chulst@polar.polarcomm.com>
Message-ID: <3220AF8F.46D2@polar.polarcomm.com>
Source record: 195296

I just purchased a Kenwood TH-79AD, with a serial number beginning 7040. I performed the "beyond MARS" mod by pulling the two diodes as indicated on the mod sheet at http://www.qrz.com/mods/ However, I found that my radio receives "only" 118-174 and 410-470 instead of 85-180 and 400-511 like the mod sheet said. Clayton, KD4IDN, who edited the mod sheet, has not yet responded to my E-Mail message. Has Kenwood reduced the range on the newer radios, or did I perform the mod wrong? It transmits 136-174 and 410-470, so I can't imagine I got the mod wrong.

Anyone with any input, please e-mail me as well as posting your response. Thanks!!!

Hello Eveybody,
I am looking for a HyGain tape measure dipole antenna. This antenna
is actually two tape measure built into one piece, including the
feedpoint. All you do is pull out the apporopriate amount of tape to
operate on your frequecny, and you are on the air!
If you, or anybody you know, has one of these antennas for sale,
please E-Mail me as I am interested in taking it off your hands!
Thank!

3349. Re: "New" Ken. TH-79AD?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-25 00:00:00 UTC
From: "Jim Gerke, KC5OA" <jgerke@why.net>
Message-ID: <3220DBFF.71BE@why.net>
Source record: 195303

I owned an original TH-79A (not the "D" model) on which I performed the same mod. It expanded as advertised. Along the way I sold the 79A. Later, my son and I each acquired TH-79A(D)'s. I modified both of them using the same mod. Like yours, both of ours expanded to only 410-470.

Kenwood obviously made a change to the 79A(D) which changed the effect of the mod.

73, Jim, KC5OA

Hi Ted
I have an AEA, my friend has a Kantronics -- we both love em. Some are VHF only. Others are all-mode such as the AEA-232MBX that I own. A lower cost entry is the Baycom modem marketed by Tigertronics Inc -- E-Mail at Tiger@hq.jcic.org

Also be sure to read WB9LOZ's excellent excellent tutorial at URL:

http://itg-pc1.acns.nwu.edu/~odenbach/classes/c96/packetradio.txt

Highly recommended

Good Packeting

3351. LCD display

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-25 00:00:00 UTC
From: Torpor@fnal.gov
Message-ID: <4vqg5e$ekb@fnnews.fnal.gov>
Source record: 195305

I have a Uniden scanner with an LCD display. If the unit is
mounted under the dashboard, the display can be read easily.
But if the scanner is mounted overhead (as in my van), the
display is impossible to read. The LCD digits seem to fade out
when the radio is above the observer. (I'm making an assumption
that the manufacturer intended under-the-dash mounting.)
Is there and easy fix for this?

By goom, you're right! I did it the hard way - I noticed Ken Harker had capitalized a V in the middle of one of his sentences. I assumed this was "I" (what other single letter do we capitalize?) and translated (rotated) the alphabet accordingly. Everything fell out nicely from there.

After deciphering "If you can read this, you really ought to get out more," I decided the effort greatly outweighed the rewards!

> Scott KD6CQ
> scotgray@cwnet.com

Hi Scott-

You might solve the problem on the C Line by loosening the setscrew in the main tuning knob, and pushing a little on the front of the knob as you tighten the screw again. Go easy at first, because you don't want TOO much tension there. But if the knob is too loose, there will be unintentional slippage and you'll lose calibration as you go up and down the dial.

The problem you are referring to may be something else entirely, but I thought that this might be what you are talking about.....

Good luck and 73, Tom KJ5IE

3361. FS: Icom IC-W21AT Dual Band HT

Newsgroup: rec.radio.amateur.equipment

Source record: 195316

Just like new (listed in current HRO catalogue for $529.95)

Interfaces with many ICOM radios - totally automatic
Very small and lightweight. Can be placed atop the radio

Presets 'remember' settings for each band; tunes in just seconds

Much more capacity than some built-in tuners, even handles a long wire

Accepts up to 3 coax outputs to antenna(s)

Complete with original carton and documentation

(Up to 150 watts input; then feed its output to an amp if desired)

Make an offer. Include cost of shipping.

Source record: 195357

Hello,

Lately UHF HT600s are running in the $200-$250 range. This is VERY dependent on them being the 449-470 version and not some off the wall 490-520 or 406-430 type. Good radios and with the DTMF and charger, $250 probably wouldn't be to much.

Tom

>
>You neglected to mention a very important part of this installation. FUSES! You should put fuses in both lines going to the battery. Yes, both positive and negative.

Fuse holders can be bought at Auto parts stores and/or hamfests.

I did it this way: ----|
| |-----------|
Battery + ---------| | |----------------
| |-----------|
----|

```
|----
|-----------| |
Battery - ---------| | |----------------
|-----------| |
|----
```

Note the reversed fuse holders. If they are installed this way, the risk of connecting the polarities is greatly reduced.

See if a local radio shop or a technical ham can look at
the transmitted signal in a communications monitor.
This will tell if it is transmitting tone.
They can also verify the frequency of the tone (if any).

yeah, when they work they're grand. but there seems to be little if any rechecking to see if a url on file at a search location is really there - so you might get 1 of a million possible listings with about 999,000 of them unusuable at all.

of course, there's one location where you have to download files (getting a catalog), expand, run an installation program on the data, then you find you have a bunch of directories and a ton of HTML files to pull up in the browser to view 'em...(now, THAT'S comedy). <sigh>

Jeff, you're using the built-in newsreader in the Netcruiser software.
It's crap. Try using Free Agent -- and, if you like it, you can buy
Agent -- and you can do ROT13 with a couple of mouse clicks. Much
more importantly, you can also do most of your Usenet news stuff
offline.

>Ben Johnson

Ben,

The specifications for the 736 / 738 tuner are 16.7 to 150 ohms maximum. That a max of a 3:1 mismatch. Do not expect to tune into a greater SWR as it is simply not designed to do so. Also you have to consider the high voltages a high SWR causes with in a tuner and you could damage it tuning into a high SWR. You need to fix your antenns so it presents a SWR of no more than 3:1 to the tuner. Manual tuners have more physical room for larger componets and impedance range to exceed 3:1 mismatches,as the capacitor plate spacing must be far enough apart to accomdate the high voltages a high mismatch generates in the tuner.

: wheel, you would cipher the text by rotating the wheel 13 spaces

The reason for rot13 is not to encrypt a file to keep unwanted recipients
from seeing it. It's just a way someone can post something which can't
be read accidentally. Like posting a joke which someone might find
offensive to a humor group. If someone is just rifling thru the jokes
they won't be offended unless they deliberately decode the rot13.
Another use might be for a post which "spoils" or gives away the plot of
a book or movie.

3386. Help! Yeasu FT-2400H Display problem.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-26 00:00:00 UTC
From: Jeff Carlson <techware@skypoint.com>
Message-ID: <3221AAFD.4DFB@skypoint.com>
Source record: 195179

I've owned the FT2400H for years with out a hitch. All of a sudden,
the display goes haywire. Seems to be randomly indicating segments of
the display. Freq reads ***** instead of a number, each segment is shown
as enc, dnc, low, but not having anything to do with the settings
of the radio. The unit seems to still listen and transmit on the
programmed freqs, but I have no idea what they are.

Anybody seen this problem? can you help?
Please respond by post reply if possible.

>KA1VBU...........Dan

I agree. I bought one of the $30 closeouts, and use on my Icom 706.
The radio has only the stock filters installed, so the DSP made a
difference. It isn't worth the original list price, but it is worth
$30.

Like others have posted before, it's a good CW filter. The SSB modes
are so-so, although the auto-hetrodyne filter works well. The noise
reduction mode is almost worthless, especially when compared to a
Timewave or other "real" DSP.

When the TH-79 first came out, amateurs were upset by the lack of a memory lock-out feature. With 80 memories, one needs to have a way to lock out certain ones while scanning.

Kenwood re-developed the CPU to add this feature, but as a side effect, the extended receive coverage was shortened. It appears that you performed the modification correctly. I have owned 2 TH-79s, one new and one old.

3390. Kenwood TS-440 antenna tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-26 00:00:00 UTC
From: sbertsch@x1.us.ohio-state.edu
Message-ID: <4vskdt$i0i@charm.magnus.acs.ohio-state.edu>
Source record: 195183
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I've had a TS-440S/AT (bought used) for about a month now, and I just noticed the antenna tuner can't find a match at 25.500.00 MHz or above, even into a 50 ohm dummy load. Relays click, motors whir, but the SWR never gets below about 2:1, so the thing just keeps trying until I turn it off. At 25.499.99 and below, it finds a match.

Anyone have any idea what's going on here?

Thanks,
Steve N8KWV

I have mounted an antenna on the back corners of the roof. Since
I have the sunroof and the roof rack, that was the only place left!
They have worked out well and perform very well at those locations
(440 and 6m). There is just enough room for a mount there, which is
accessible when you remove the back plastic cover along the top of
the rear window. You can then run your coax along the sides of the
headliner.

Be sure to buy antennas that fold over (like Comet) if you plan on
entering any parking garages...;-)

I've owned several each of the HW-7 and HW-8. I prefer the performance of the modern kit-built rigs (assuming you buy a superhet receiver and not another direct conversion receiver, which the HW-7 and -8 have). It is usually cheaper to buy an HW-8 than several single-band rigs, but in my humble opinion (formed after nearly 20 years of QRPing) the modern receivers have the HW-7 and -8 beat hands down. I have no experience with the HW-9 (in fact, hard as this may be to believe) I've never even seen one in person.

I have an NN1G Mark I on 20m, and I like it very much. I also have an NE-4040 on 40m (also known as the SW-1), and I also like it a lot. Both of these are less than $60 in semi-kit form (you supply enclosure, knobs, pots, jacks, switches, hardware, they supply PWB and all components). I recommend both of these.

: Is there and easy fix for this?

If you get a hold of the schematics (big if?) look for the bias/contrast resistor that goes to the display. It gets into voltage vs. angle of incidence and more math than I can remember, but adjusting the voltage will chage the viewing angle. Did something similar to a keyboard that had an LCD in it.

> donw@pe.net

Don,

I've used an HW-8 since the late '70s (I think :)).

The rig has provided me with lots of enjoyment, and its performance is impressive for its size. Using simple wire antennas, I've confirmed about 40 states and 20 countries without really putting my mind to it.

On the bands, in general, 2W is too little to maintain a comfortable QSO. Most often, the other fellow gets tired of the low, easily stepped-on signal and says "my wife is calling, must QRT." I've been able to achieve the minimum QSO (callsigns and reports both ways) with many stations, but I've had good ragchews with only a very few patient ones.

About midway through my HW-8 career I purchased a used Ten-Tec 405 amplifier, which gives the HW-8 about 50W output. The amp was money well spent. It allowed me to run QRP, and kick in the 50W when the going got tough (usually after the 2nd or 3rd exchange of a QSO). 50W seems to be enough for the other fellow to hang in there without the "quick QRT."

HW-8 good points: Small, light, little chance of tvi, good cw waveform, very easy to use, rugged.

HW-8 bad points: tx/rx switch is via relay which lacks adjustments, hum on rx audio (mentioned in other posts), lack of rx audio volume, only 2 position rx filter, RCA jack for RF output, lot of external parts needed for a working station (keyer, speaker, audio xfrmr, PS).

Modern QRP rigs like MFJ's series have cured many of these bad points, but at the expense of an important differentiator: MULTIPLE BANDS. For some reason, today's QRP designs all tend to be monoband, whereas the HW-8 can cover 4 bands (80,40,20,15).

Of course, the 20 and 15 meter bandswitches aren't worth pressing until the cycle picks up.

I wouldn't consider the HW-7 at all. If the HW-8 is ancient, the HW-7 is REALLY ancient. As I recall it had crystal-controlled transmit, too restrictive with today's crowded bands.

The Ten-Tec Argonaut is well worth considering, if you can spend the extra money.

Good luck!

Rich, WB2MBM

Hi there, another possibility is that it IS transmitting the tone but
it's not strong enough. You might have to get someone to turn up the
level of the tone. It's easy to do but you need to know where the pot
is.
Good luck, Mark N2FLF

3399. Yaesu FT-50R, CW ID, DVR, DTMF Auto-Respond Paging

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-26 00:00:00 UTC
From: "Gary L. Crum" <crum@xmission.com>
Message-ID: <322209E5.3668@xmission.com>
Source record: 195192

Anyone else using the fancy new 50R features?

It's CW ID is pretty neat, although there does not seem to be a way to simply cause the ID to playback on demand. It seems to be used for ARTS and also when DTMF auto-respond paging is used.

When in auto-respond paging mode, with the FTT-12 Digital Voice Recorder message recording on, the radio responds automatically, identifying itself using CW, as long as the caller does not remain keyed up longer than about 4 seconds after the paging tones are sent. Then, after the CW ID, the 50R plays back a recording of the caller's audio. If the caller remained keyed up more than 4 seconds, then the radio does record the audio after the call, but does not respond. I wonder why not.

I was thinking that the radio could be legally automatically controlled because repeaters are a type of operation that can be automatically controlled. But, the definition of repeater has changed recently, and now a repeater must repeat simultaneously on different frequencies. Oh well. Maybe the radio can be considered to be remotely controlled and thus still be legal even when it is automatically responding, even if it is not locally controlled.

Oh yes, and in another mode, the radio can playback a previously recorded message (instead of a short caller's transmission) when the radio responds to a DTMF paging call.

3408. Windows Logging/Packet) Freeware

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-26 00:00:00 UTC
From: "Mike McAmis"
Message-ID: <4vtboa$7pj@dartvax.dartmouth.edu>
Source record: 195201

Disappointed with your commercial/shareware logging or
packet software for Windows? Try XMLog, freeware that's
available on the Internet. XMLog provides a flexible set
of coordinated logging and packet features.

If you're using a Web browser, start at Boston Amateur Radio
Club's home page (http://www.acs.oakland.edu/barc/barc.html)
- scroll down to the "BARC FTP Archives" section
- click on "FTP Archive"
- scroll down to "Software Archives"
- click on "PC Files"
- click on "logging"
- scroll down and click on "xmlog124.zip"

(Even though the directory says DOS, it really is a Windows
program...)

For ftp users, sign on to ftp.barc.org with the userid
of anonymous and a password of guest. Move to the
/pub/hamradio/dos/logging directory and get xmlog124.zip

XMLog is now also available from ftp.funet.fi in Finland.
Sign on with a userid of anonymous and supply your e-mail
address as the password. Move to the directory
/pub/ham/hf-log and get xmlog124.zip

Version 1.24 has mostly minor improvements - the big changes
are DXCC/WAS/WAZ award submission tracking and support for
the Radio Amateur Callbook (Flying Horse) CD.

Version 1.23 is still available for those with PC's that
only have 4mb of memory (1.24 requires 8mb).

The archives can be busy at times, don't give up if you
can't sign on right away. Let me know if you:
- want more info
- can't fetch the file
- want diskettes instead

Have fun...

I Have one Zetron Model 810 Digital Hybrid for sale. This is a 2-Wire to 4-wire converter with digital signal processing. It typically is used to connect a standard telephone line to a mobile radio system. It will enhance the audio (especially full-duplex) in trunking, conventional and cellular radio systems.

This unit is in excellent condition. It was in-service for less than a year.

Rack-mount. With Instructions.

Originally purchased for $900. Will sell for $600.

The intermod performance is Ok, but the Mr. Potato Head mic is
bizarre. The Smart Controller mic is a more traditional set of
push buttons used to control the rig.

I want to suppress the ignition noise I am receiving on an HF transceiver installed in my mini-van. I went to install a noise suppression filter on the ignition coil, and found that there is no coil or distributor on this van. I am not familular with this type of ignition system, so any help would be appreciated. I have the following van:

1996 Chrysler Town& Country LXI
3.8L V6 engine.

The noise is not bad enough to obscure desired signals, it is just anoying to constantly hear it. Chryslers advice was to give me a TSB that appeared to be written by Amateur radio operators. However it did not address filtering the ignition system.

Thanks for any help:
Bill

Can anyone tell me about the format or the layout of the debug table that comes up after executing
WFT50.exe /DEBUG. The additional commands are located under the FILE pull down. I called RT Systems but
they either couldn't or wouldn't tell me anything about the layout. I suspect that it is the band plan and
that modification can alter the characteristics of the radio. Perhaps even make it a tri or quad bander.
I will continue hacking away at this and if anyone else has any success please let me know.

I have TWO Zetron Model 50 DID Telephone Trunk Converters for sale.

These both are in BRAND NEW CONDITION. They were in use for less than a year.

A DID (direct inward dial) line allows each mobile radio or pager to be reached at a unique, seven-digit telephone number, just as in cellular service. A caller doesn't have to overdial extra codes in order to reach a radio or pager.

They were designed to be used with a Zetron Model 45B (Z-Patch), 46 (Trunked Interconnect) or Model 48B (Repeater Manager) but will work with ANY DID installation.

Rack-mount. All manuals included.

This allows each subscriber to have his own unique telephone number!

Original price was $1,000 each. Willing to sell for $1200 for both or $700 each.

My guess is that you have a relay, related to that frequency range, that is not switching properly. I've had no problems with mine but have been told by others that when a relay goes bad, the tuner won't stop hunting.

Good Luck.

There are two basic mechanisms for signals to enter the radio: conducted and radiated. Before you assume the cause and the cure, you should determine as best you can if one or both mechanisms are operating.

Conducted signals usually enter via the power system. In a mobile that will typically be via the battery or a switching supply. It is good practice to run a heavy bus wire from the battery to the radio (if it operates off of the battery) or to the switching supply. If conducted signals are still present, then adding filtering near the battery is the next step. Your ground for the radio should also be low impedance.

Radiated signals usually enter the radio via the antenna. This is the toughest interference to reduce. The signal (noise) most likely is generated by the ignition system. Shielded spark plug wires is one method for reducing this radiation. While there are other, more exotic methods for suppressing the noise, it is hardly worth the effort.

One quick check for determining the type of noise is to disconnect the antenna. If the noise is greatly attenuated, the mechanism is radiated noise. Otherwise, the noise is conducted. And you could also have both mechanisms working.

Note that my reference to switching supplies is directed at transistorized power supplies used with vacuum tube radios. That kind of supply can create its own interference.

Good luck,
W0MAY

3424. IC-738 AutoTuner Problems?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-26 00:00:00 UTC
From: Ben Johnson <bjohn@concentric.net>
Message-ID: <32222685.5FEA@concentric.net>
Source record: 195317

I just bought an IC-738 HF rig. I would appreciate any comments from other IC-738 or 736 owners regading the performance of the autotuner. Either my rig is not working properly or my expectations for the autotuner's performance ar set too high. Here is what I am seeing.

Using my G5RV multi-band dipole the best SWR achieved (as measured with an external meter is around 2.5 - 1 at 20mtrs. It gets worse at 40 and evn worse on 80. At first I assumed antennea problems so I took the rig to another hams location where he had multiple antenneas to play with.

On his tri-bander at twenty meters it would autotune to around 1.6 -1. On 40 meters it would autotune to 1.1 -1 at the ssb portion of the band but tune to 2.0 -1 at the CW portion. With out much effort and using an external ant. tuner (bypassing the autotuner) we could easily achieve 1.1 matching all across the HF spectrum using the appropriate ant. Yet what should be a fairly easy task for an auto tuner turned out to be, more often than not, a disapointing performance (3.0 -1 and sometimes greater SWR).

Again, if anyone has one of these rigs I would like to hear about your rigs performance re. the autotuner. My basic concern is, do I have a problem with a brand new rig? Thanks in advance for your input.

Hi,

And welcome to rec.radio.amateur.equipment. You're doing great if you've only been on Windows 95 for a few days!

Your electronic mail program should have a "preferences" or "setup" option where you can specify your "signature", a way of signing your email messages. Of course you can just leave your name and email address at the bottom of your message.

I owned an 850S/AT for 5 years and it is a great radio. I don't think you'll find a better buy for the money. Used 850's go for between $1,000 and $1,300 depending upon their condition, filter and other accessories suppied,etc. You can check Ham Radio Outlet or other vendors that are on-line; I believe that the price of a new 850S/AT is approximately $1,699. Since you mentioned you're a CW operator, it's a good bet you'll want some of the optional CW filters. The slope tuning, however, is all I used for my CW operation, and in many cases it was sufficient to cut down QRM due to adjacent signals.

Other Radios in the same market segment of the Kenwood include the TEN TEC OMNI 6, Yaesu FT-990, and Icom makes a good competitor, although I can't remember the model.

Good luck with your new radio and with Windows 95 and the Internet.

73,

Well, it isn't exactly 'flawless'...

>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>freq...and vice versa.

Oh, you've got a huge PLL settling delay. That *is* a flaw in 9k6
operation. 250mS? I won't use a radio that requires that much
TXD on 1k2. The problem is that a radio with that much delay
contributes significantly to hidden transmitter syndrome, *even on
a duplex repeater*. There's a huge window from the time you
activate PTT until your radio starts spewing a carrier, which
invites other stations to collide with you.

Also, the receiver recovery time means that you'll probably miss
rapid replies, they'll timeout and retry before you get the
frame. This won't happen if other stations are running similarly
long TXDs, but then you're really throwing away the 9k6 advantage
(a 256 byte frame doesn't take much more than 250mS to send; so
a TXD of 250mS represents a loss of 50% of potential throughput).

>Other than that...I like it very much, and it works well.

Um, save up your cash (under $150 for a clean Mitrek and rocks) and get
a radio that switches in 50mS (or less) and you (and all the others on
the same channel) will be much happier.

>>I am thinking of purchasing a handheld scanner

>>I have been told the following units are quite nice:

>> Uniden BC3000xlt
>> ICOM R1
>> AOR 2700

Currently I have PRO-26, AR2700, and AR8000 handheld scanners. At the street price of around $200, I'd suggest the AR2700 as a best buy. While the RF and audio isn't quite up to the '43's, it's not that bad either. The two features I prefer over the '43 is the attenuation by channel (on all three models) and the computer interface to dump and load the frequencies. I do find the keyboard operation of the 2700 quite cumbersome for a scanner. It's virtually impossible to link in additional banks while drive.

My two cents worth.

I would insert...
Because 0) electrical codes require that a generator not feed power back into the utility for the protection of utility workers

I use a nice product called a GenTran which is advertised in the Honda generator catalog and is offered at Home Depot among other places. It is totally idiot-proof and potentially homeowner installable if you know what you are doing (if not or if you think you do, but don't, hire an electrician). There is no way to fry the utility worker or the generator with it.

It's not your usual transfer switch (which transfers the entire load center between generator and utility power). Instead, it has a series of double-throw (center off) switches and 15A circuit breaks. You choose which of your load ciruits you want to be switchable to generator, and pull the load wire off the breaker, connect one side of the gentran switch to the breaker and the other side to the load wire and then you individually chose which circuit goes on line, off, or on generator. This way, you can put the refrigerator and rigs on generator but leave some room lights on the utility so you can tell when the utility is back:-)

By switching in one circuit at a time, you can make sure not to overload the generator (the gentran even has an ammeter on each leg). Depending on the season, you might want to switch your heating or cooling systems in with different switches on the gentran. You can also switch 220 loads in the usual handle-tie way.

There are a variety of models available from the manufacturer which are not all stocked by Home Depot. Specifically, they make a weather-proof enclosure which is what I wanted for my partuclar situation. H-D only stocked an indoor model last I checked.

Not familar with the 733 but I'd highly recommend the 8500 - my needs
just changed. Give me a call at (513) 2560647 if you interested in
more info - will discuss my radio or price - either..kb8tpw Ray

In a message dated 96-08-27 11:27:17 EDT, you write:

<< I have a SCOUT 25, with the AC adapter (no manual, call OPTO, they'll
send
it)

$175 + ship

Doug

>>
Hello Doug,
I am interested in your offer... Wondering however what the difference
in
the Scout 25 compaired to the new models?? Please let me know.... but,
while
you let me know please let me know how we can work this deal out. Cause I
do
want it from you.

Please let me know A.S.A.P so that we can both get the deal done.
I want to work things out quickly cause we are moving soon and
would
like to use it to gain frequencies in my new area.

Jeffrey Dubin
9232 Cedar Lane
Des Plaines, IL 60016
(847)824-2112

The reason I am posting this here is because DOUG didn't leave his proper
address to reply back to his deal. His address is as follows:

Subj: Re: WTB: Scout (Frequency Counter)
Date: 96-08-27 11:27:17 EDT
From: put.your.whole.email.address.here@digital.net (Put Your REAL Name
here)
To: n9mxt@aol.com

Doug if your out here... please email me back with your proper address or
post me a message via this newsgroup!

Thanks... N9MXT -
Jeffrey

3441. Wanted: Icom W21AT DUAL BAND (2m/440) hand held.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-27 00:00:00 UTC
From: Ron in Seattle <ron.in.seattle@pobox.com>
Message-ID: <322394AD.5B99@pobox.com>
Source record: 195134

I want an Icom W21AT. Here's what I have to trade:

-Phone/Modem/Fax/Sound Card: Diamond Telecomander 3500XL Professional Voicemail System, 28.8 Internal Fax/Voice/Modem, CD Quality Multimedia 16-bit Sound, Full-duplex speaker phone, Jumperless Automatic Installation. Soundblaster compatible. Midi/Joystick port, $150

-Video Card: PCI Movie Video card, VideoLogic, 2 meg onboard Vram, 16.7 million colors, Weitek Power 9100 graphics controller, works with Windows 95 (or Win 3.1) refresh rates up to 120 hz, full screen movies, ideal for CD multimedia titles, 16x faster Windows performance, 24-bit true color, resolutions up to 1280x1024, upgradeable with a VESA Media Channel (for video conferencing, mpeg playback or other). $145

VIDEO EQUIPMENT
-Sony Handycam Model (CCD-FX230 NTSC8) Video 8 with 10x variable speed zoom, back light button, full range auto-focus, date/time stamp, with remote control option. Less than 6 total hours of use, with NO damage or even cosmetic scratches! (new $540). Quick charger and cables to connect to VCR, new (1 month old) battery, (new $59) clip on battery meter and light bar, (new $58) car power supply, (new $48) 3 blank tapes (2 never opened), (new $20)
mini tri-pod, (new $27) wide angle lens telephoto lens. (new $142)
Purchase price $894, asking $425 for bundle. (Sold as package only)

-Pocket LCD Color TV (Radio Shack Pocketvision 30), 2.5" active-matrix for rich, high-resolution picture, digital tuning, telescoping rod antennae, built in speaker and jack for earphone. Has AV in jack (perfect for use with camcorder for playback instead of using eye-piece on camcorder). Sells new for $229.99, asking $150

ELECTRONICS
-DustDevil Plus vacuum and attachment kit. $25

-Shortwave Radio: Sony FM/AM Multiband Receiver, ICF-6800W, Shortwave Synthesized Dual Conversion Receiver, Modes = wide/narrow/USB/LSB/CW, (FM 87.5-108MHz, MW 530-1605kHz, SW 1.6-30MHz 29 Bands, digital tuning display, AM RF Gain, antennae tuner, preselector, seperate bass/treble, standby, light/battery/tuning dial, AFC, memo-lite, scale adjust, jacks = headphone/earphone/record out/timer/sw antennae input/mw antennae input/coax antennae input, rod antennae, AC/DC (110/120/220/240 volts). $225.

-Car CD Changer, Pioneer 6 CD changer. Uses standard Pioneer CD magazines, comes with at least 3 magazines. Works great. Must have a Pioneer receiver made to control the changer. Asking $170.

-TV, B/W 13", works great. Clear picture. Older model. $20.

-TV, Color 15" RCA, great picture, very reliable, older model, works perfectly. $40

-Radio, receives AM/FM/TV, General Electric Model 7-2930B, earphone jack, uses 4 AA batteries or included wall cord. $15

-Radio, receives AM/FM/TV & Weather, Emerson Model PM3909, earphone jack, uses 4 C batteries or included wall cord. $18-TV, B/W 13". Works fine. $15.

-Antennae, cell phone, "On Window" 5 dB Gain Cellular by Mobile Mark (model OW-5-900). $5.

-Wire & circuit tracing system, Brady Pathfinder 12-A, Can identify 12 circuits at a time. Use simple procedure to eliminate time and cost of retracing when re-wiring provide extra margin of safety. for Perfect for tracing phone lines, auto wiring, antennae leads, much more. Works perfectly. Use imagination :) $50.

-Coffee Maker, Mr. Coffee 12 cup, black, very clean, with filters. $5

MISC
-Trailer, 4' wide x 8' long x 2.5' deep. In good condition, licensed, spare tire. $190.

-Full wall photograph, 8'x 8' photograph (2 pieces) of outdoor path, greenery, flowers. This is not a poster print, but a very expensive photograph mounted on 1/4" foam board. Perfect for photo sessions or incredible livening up of office, dorm, apartment, or bedroom. Sells for $300. Asking $30.

-Coat, Original Australian Outback Oilskin Coat, Medium, black, New for $165, Asking $60.

-Flight suit, Military issue CWU-27P Polyamide high temperature resistant, sage green. Size 36-R. Great condition. New for $125, Asking $20.

-Remote Control Pickup, Nikko brand, custom military paint job. Looks great, runs perfect, needs no work. 2 channel full function remote 27mhz, low & high gear, two 7.2 Ni-cad batteries, quick charger. $40.

SOFTWARE
-PC Study Bible 1.7 for Windows with the following add-ons:
1. New Exhaustive Strong's Greek-Hebrew Dictionary and Englishman's Concordance, 2. Definitions from Thayer's Greek Lexicon and Brown-Driver-Briggs Hebrew Lexicon 3. Interlinear Bible
4. Living Bible 5. Treasury of Scripture Knowledge 6. Matthew Henry's Commentary....Asking $75 for bundle.

Hi all, I am looking for a new repeater controller. We have been using the CAT-300 and CAT 500. We are going to put up a new repeater or two and need to know if there are any other good controllers out on the market.. Also we are looking for a cheap CW identifier for one machine we already have in use.
If you have any info please E-mail me at jackqm@sinsa.com
Thanks for reading.

You might check yout the FT8000, looks like something analogous to the
FT51 --> FT50 release. Some new features, some deleted, lower cost. I have
not talked to anyone who has the FT8000. But the FT50 was apparently well
received, and I like my FT51, but might have gotten the FT50 if it had
been out at the time.

I need to replace the 0.05 ohm 5% 5 watt resistors in my Astron RS35M.
Astron will supply them, $1/resistor plus shipping plus the phone call
but they don't take a credit card.

I've checked Digi-Key, Mouser and RF Parts and I can't find the .05.

Does anyone have a 1-800 source for such a resistor?

3448. Re: Request Comments on Heathkit HW-7, 8 & 9

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-27 00:00:00 UTC
From: rheiss@tuba.aix.calpoly.edu
Message-ID: <500ma8$1908@tuba.aix.calpoly.edu>
Source record: 195141

After comparing notes with other HW-8 owners, I found that no two have the same quirks. Like Easter eggs, it seems. Mine has a good receiver with a super smooth tuning dial and not a trace of hum, completely stock. My transmitter, on the other hand, needed mods to sound clean and look clean on a scope. Email for technical details.

I felt all my newer superhet kits needed mods, too. There has been a lot of hot air lately about how inferior the Heathkits are. Check out my ARRL DX Contest score in QST. That was my HW-8 working DX on all four bands with wire antennas. Someone else made 300 Field Day contacts with another HW-8. For field use there is the advantage of multiple bands plus the antenna tuning feature all in one sturdy box. So I still like it.

I have working equipment that was pretty old when it was given to me as a child, including a Hammerlund HQ-129-X receiver, and Heath TX-1 "Apache" transmitter with an SB-10 SSB "adapter" (the original TX-1 didn't have SSB; the adapter was an optional extra).

Does anyone have any idea of how to arrive at a fair evaluation of this equipment?

Any pointers will be most warmly received.

Thanks very much,

- Rich Alpert

Hi all,

Can anyone recommend a brand of 70cm radio from any of the major
ham-radio manufacturers that is really suitable for 9600 baud packet? I
wonder if there are any PLL sets that are satisfactory?

Thanks & Cheers,

Tony vk2tjf

Hi everybody!

I know that the W31A or E can be partly run by a remote controll i.e. from the mic. But how is it done? There is a mic available that does the trick. I want to use a headset and have buttons, that I can easy locate without looking, on a small box attached to my belt. I dont want the mic because I think it's too small.Anybody have info about this? I woult guess that it is some sort off DC-level going in on the remote-controll pin. Is that right? What are the levels?

The system that I use is to buy heavy tubular copper braid and slip it
over the spark plug cables. Ground it to the block with a short heavy
wire. I have also built a copper box to cover the ignition module
where the spark plug wires lead to. This converts the "antenna"
(spark plug wires) to "coax" (shielded spark plug wires). Of course,
a coax does not radiate like an antenna. You may also wish to ground
the hood and the exhaust pipe, but I think that covering the spark
plug wires will make a dramatic difference, while the other factors
make a minor difference. I am about to do this to my new car, but
it was very successful on my old car. You will need to explain this
to the mechanic the next time you take it in, as it looks really
strange.

I've owned probably 40 different handheld scanners in the last five years and there is no doubt in my mind that none of the above is the correct answer.

If you can find a pro-43 at a reasonable price grab it. The later ones cannot be unblocked for cellular and I've never owned one of them so I can't tell you much about them but the earlier ones (don't ask me dates) have the best audio, intermod rejection, image rejection, and ergonomics of anything that I've ever used. I've always kept at least one even though I've bought and sold many.

A friend of mine is a radio amateur and he has got this transceiver
radio:
RTX mark ALINCO
ELECTRONICS INC. JAPAN
Portable VHF
model DJ180E

He has got two questions about this radio:
1) How can he modify his radio to extend the band from 144/146 MHz to
130/170 MHz?
2) Can he receive the "manual for use" of this radio? (A photocopy of
the manual is acceptable too!)

For details, please conctact me through my personal e-mail address.
Thank you very much!

Welcome to distributorless ignition systems ("motorcycle ignition"). Here's
what I'd consider doing:

- install hash filters on the transceiver's power leads (Allied Electronics --
page 133 of the latest catalog shows heavy-duty hash chokes capable of
handling up to 5 amps). You'll probably want to construct some type of
low-pass filter. Equations for filter design can be obtained in an
undergraduate book on electronics (e.g., Millman and Taub).

- ensure the antenna's coaxial cable is WELL grounded to the chassis and that
the chassis is WELL grounded (there will be a direct ground feed going to
the battery's negative terminal -- be sure this connection is good).

- 'scope the Z1 circuit -- this is the power feed from the auto shutdown relay
-- and see whether the noise there can be reduced using bypass capacitors.
In cars with distributors, there's a single capacitor going from this
circuit to chassis ground (it's connected right at the ignition coil).
Bypass capacitors suitable for use underneath a hood can be purchased in
almost any auto parts store which caters to mechanics.

National Semiconductor had a great booklet about 10 years ago covering noise
suppression and power-line spike suppression in automotive environments (the
booklet covered a whole bunch of other things, but the automotive stuff stays
in mind).

Hope this helps.

3473. good tubes to look for

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-27 00:00:00 UTC
From: ed.welch@cheaha.com
Message-ID: <8C731F3.04090014 41.uuout@cheaha.com>
Source record: 195240

There's a rural television repair shop that has been out of the repair business for several years, basically concentrating on cable service, etc.,. They've got a large stock of old tubes. I'm planning on building an amp later in my ham carreer (like when I make it to General :)) and I thought there might be some tubes at this place that I could use. What are some good tubes to look for that are used in radio work? In other words, the standard tubes used in amps and whatever.

I noticed some old signal generators and oscilloscopes also, but I haven't a clue about them either. I'm primarily interested in the tubes.

It's all greek to me, but I could pick up some of these tubes at a reasonable price at the moment and I don't won't to miss the opportunity.

Thanks a million for your help, I think I have a good deal.....I just don't know what to look for! :)

In general the multi-mode units - like the Yaesu 736 and others from ICOM
work really well - they use a crystal for the base modulator - you "simply"
couple the TX into the crystal and you are done. They also generally don't
reprogram the synthesizer between tx and rx. There was a review of radios
for 9600 in QST earlier this year - Feb or March I think. Good luck, Dave.

I have recently acquired an IC740 which has no mic gain, and has some
output when I engage the compressor. The mic is good as it was tried
on another ICOM "worked fine". Don't need it much as I work CW
when I do operate "mostly" .

Would like to get some manuals operator and technical manual.
Copies would be fine.

please respond here or by e-mail gvang@seine.com

I lost the 2M final section shortly after my radio went out of warranty. Sent it to Kenwood for repair and it cost well over $100 parts and labor. I almost never use the 70 cm side and no problem there so far.

Postings in this news group about a year ago suggested that the heat sinks for these finals as produced at the factory were not adequate.

No problem for the last year or so. But if it goes again I may consider replacing the radio instead of repairing.

>Tony vk2tjf

Hi Tony.

I run a Kenwood 451a on 9.6k 24 hours a day. Some will claim this radio
is inadequate for 9.6k operation, and I have not had it on any test equipment,
but it runs flawlesly with my Kantronics 9612 on both, the 9.6k repeater, and
keyboard-to-keyboard.

The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
freq...and vice versa.

Other than that...I like it very much, and it works well.

Take care.

From: pburgess@primenet.com
Message-ID: <4vvb71$qaq@nnrp1.news.primenet.com>
Source record: 195256

I'm curious whether anybody has hacked something up to make these two work together? The EarPhone is an in-ear speaker/mic in one... they make versions for cel phones and PC's, but nothing that'll work out of the box with this radio. I've seen a place blowing out a Power Mac version of the EarPhone for about $50. I might get one just for a 'science project,' but if someone has tried this already and can offer pointers or tell me I'm wasting my time, it'd be much appreciated. I'd also like to add an in-line PTT button and mic gain control if that's possible. Thanks much!

3490. IC706 Antenna Tuner Protocol?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-27 00:00:00 UTC
From: wilson@afn.org
Message-ID: <4vvce9$6r9@huron.eel.ufl.edu>
Source record: 195257

The Icom 706 tranceiver provides some support for their own automatic tuners; I'd like use this support for a kind of souped-up "Tennamatic" interface to my Screwdriver antenna. (See 73, Jul79 or QST, Oct82.)

Although the IC706 instruction and service manuals don't provide any description of the tranceiver/tuner interface, here's what I believe I can infer:

The AT180/IC706 interface uses 3 signals:

BDT - (aka BOT, TSTR, and STRT) appears to be an active-low output from the IC706 which initiates a tuning sequence.

TKEY - appears to be an active-low output from the tuner which keys IC706 transmitter (perhaps at reduced power?) during the tuning process.

SEND - Is a wired-or, active-low output from the IC706 that tells the tuner the tranceiver is transmitting.

The AH3/IC706 interface omits the SEND signal; the TSTR alias is used for the BDT signal.

Can anyone out there confirm or deny my inferences?

Jim Wilson
WA5BRB

I think. Therefore, I think I am.

From: jco@convex.com
Message-ID: <4vvgdn$4vl@slinky.convex.com>
Source record: 195263

My 738 antenna tuner works great!

I may be reading something into your question, but are you measuring
the SWR between the 738 and the antenna, or are you reading the swr
from the 738 internal SWR bridge? I don't know what a swr reading
between a tunner and antenna might indicate. I think that you really
want to measure the swr between the tuner and the transmitter, which
you "can't" do with an external swr bridge when using the 738 internal
tuner.

Can't above may be a strong word. There may be a way of disconnecting
the xmtr to tunner connection within the 738 so that you can add a swr
bridge.

It is true, that the 738 does may not tune a "random wire" antenna.

>Illegal to sell or advertise for sale. Violates FCC rules. May even (most
>likely) be illegal to operate since it oviously has never been properly
>certified.

First of all, Tom, if you will read Mike's original post, you will see
that he is asking for info. I am merely passing on some. No one is
selling anything or advertising anything for sell. The spec's are
merely for comparison to other amps of this type. Probably right
about it not being certified, but then neither is the Palomar that
Mike mentions.

>>IMD: -33dB
>
>Against what? What product? What reference? (Sounds like a number just
>thrown out from nowhere!)

Actually, it is based upon single tone output @ 14.2 MHz.

>>Independent Pre-Amp Gain: 10 dB
>
>A pre-amp for HF Ham gear???

Where have you been lately? Check out any Icom HF rig that has been
made lately and you will find a button labeled "PREAMP" or in the case
of the IC-706, "P.AMP". Yeasu also has a HF rig or two that has one
as Bill noted in his reply to your post.

>>Electronic Input Attenuator
>
>What is it, PIN diodes? Is it variable? If it is not variable, why is it
>electronic?

It does not use PIN diodes and it is variable. It does not use the
standard resistor network that most amps of this type use to attenuate
the input signal. It uses a series of inductors and diodes.

>>Dual High/low inputs
>
>What the heck is that? High low impedance,

No Tom, this is not an audio amp.

> high low frequency,

No Tom, Mike was asking for info about a RF amp for HF

>or high low power?

BINGO!

>>Wrap around heatsink
>
>Cool :-) What does that mean?

C'mon Tom, do I REALLY have to explain what "wrap around heatsink"
means? I'll give you a clue: it has to do with the heatsink being on
more than just one outside surface of the amp.

>This all sounds like CB jargon. Like putting saltwater in a jar for a
>ground. Just by the fact the terms are incorrect, it makes me suspect that
>this is just a sales pitch for another poorly designed illegal CB amp.

Tom, you are certainly entitled to your opinion, though you are
mistaken if you think that this is a sales pitch; as stated before,
just passing on some info.

>Who is the manufacturer, and where is their address?

Haven't a clue.

>What is the FCC type acceptance number?

Don't know if it even has one. Doesn't matter; Mike wasn't asking
about, nor is this thread about, FCC type accepted amps.

>If they openly break laws, how do we know they are honest
>with us on claims?

You don't.

>If they have to hide, how do we get a warranty
>or service?

If you are buying one these types of amps, do you *really* expect to
get service or a warranty? My guess would be that it is whatever you
can arrange with the person that sold it to you.

>73 Tom

Band is related to the band expansion programmed into the radio ...
the euro models show Band 3 on VHF and 5 on UHF. A firend of mine has
modified the values to 7 / 7 and the radio now has full coverage from 76
to 999.999 KHz (no holes).
I'm still tying to change mine values ... but the radio refuses to do
so. More as soon as I will reach a conclusion.

The second parameter seems to have no effects ... boh

The last four relates to trimming values, the FT-51R does not have hw
trimmers. Take note of the original values before changing them!

3500. Europe Repeaters Tone Burst

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-27 00:00:00 UTC
From: "Richard F. Gillette" <w9rsu@starnetinc.com>
Message-ID: <3223C5AB.74A2@starnetinc.com>
Source record: 195267

Will any of the Touch-Tones open European/Great Britian repeaters?
The low group A, B, C, & D use 1633Hz. plus their low group frequency.
Number 1 uses 697 & 1209 Hz. With any unlinearity they may mix
(697+1209=1906). For the last trip I made to Europe I obtained German &
Austrian Licenses, but my HT did not have a Tone Burst, hence I could
not open most rereaters. Could I have used the Touch-Tones?

The QST reviews on HTs do not cover the burst. Do any HTs Made for the
US market have Tone Burst.

What about the IC 706?

In article <4vvri9$c0r@abyss.West.Sun.COM> myers@West.Sun.COM (Dana Myers) writes:

Hello Dana.

>>I run a Kenwood 451a on 9.6k 24 hours a day. Some will claim this radio
>>is inadequate for 9.6k operation, and I have not had it on any test equipment,
>>but it runs flawlesly with my Kantronics 9612 on both, the 9.6k repeater, and
>>keyboard-to-keyboard.

>Well, it isn't exactly 'flawless'...

How so?

>>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>>freq...and vice versa.

>Oh, you've got a huge PLL settling delay. That *is* a flaw in 9k6
>operation.

Well I wouldnt call it a "flaw"...I think what you mean is "unacceptable". And
it should be noted, that referes to you...not necessarily anyone else.

>250mS? I won't use a radio that requires that much
>TXD on 1k2.

Fine...again...those are your standards, and you should be comended for keeping
such high standards, but the fact is...most folks use 200 to 350ms TXD @ 1200
bps.

>The problem is that a radio with that much delay
>contributes significantly to hidden transmitter syndrome, *even on
>a duplex repeater*. There's a huge window from the time you
>activate PTT until your radio starts spewing a carrier, which
>invites other stations to collide with you.

I wouldnt call it "significant", nor would I call the window "huge". fact is,
the PLL lock takes less than 250ms...it is set there to allow a buffer. But you
are correct about the collisions, however, collisions can happen even with
rigs set at 50ms.

>Also, the receiver recovery time means that you'll probably miss
>rapid replies, they'll timeout and retry before you get the
>frame.

True, but I have not experienced that problem. Granted there are not a lot of
users on 9.6k in our area, but all of my operation has been solid, with no

retries.

>This won't happen if other stations are
>running similarly>long TXDs, but then you're really throwing away the 9k6
>advantage>(a 256 byte frame doesn't take much more than 250mS to send; so
>a TXD of 250mS represents a loss of 50% of potential throughput).

You need to consider more numbers in your formula. If PACELEN is set high, and a few other parameters that escapes me right now, one can TX and RX a very large block per transmission/reception. I can collect (and send) a full paragraph per transmission. The difference between 1200 and 9.6 on my station is obvious.

>Um, save up your cash (under $150 for a clean Mitrek and rocks) and get
>a radio that switches in 50mS (or less) and you (and all the others on
>the same channel) will be much happier.

While I appreciate your comments Dana, not everybody has the experience, know-how, and money to do everything "the best way" on their first try. Just like the recent threads about taking better advantage of higher speeds in the higher bands...I am doing just that.

Yes, I may not have the "best" setup, but I am sure not going to critisize someone who is trying to move ahead...regardless of their equipment.

Take care.

3506. Wanted: Icom ICW32

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-28 00:00:00 UTC
From: Ron in Seattle <ron.in.seattle@pobox.com>
Message-ID: <3224A093.3278@pobox.com>
Source record: 195073
Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment

I am looking for an Icom ICW32 and have the following to trade:

-Phone/Modem/Fax/Sound Card: Diamond Telecomander 3500XL Professional Voicemail System, 28.8 Internal Fax/Voice/Modem, CD Quality Multimedia 16-bit Sound, Full-duplex speaker phone, Jumperless Automatic Installation. Soundblaster compatible. Midi/Joystick port, $150

-Video Card: PCI Movie Video card, VideoLogic, 2 meg onboard Vram, 16.7 million colors, Weitek Power 9100 graphics controller, works with Windows 95 (or Win 3.1) refresh rates up to 120 hz, full screen movies, ideal for CD multimedia titles, 16x faster Windows performance, 24-bit true color, resolutions up to 1280x1024, upgradeable with a VESA Media Channel (for video conferencing, mpeg playback or other). $145

VIDEO EQUIPMENT
-Sony Handycam Model (CCD-FX230 NTSC8) Video 8 with 10x variable speed zoom, back light button, full range auto-focus, date/time stamp, with remote control option. Less than 6 total hours of use, with NO damage or even cosmetic scratches! (new $540). Quick charger and cables to connect to VCR, new (1 month old) battery, (new $59) clip on battery meter and light bar, (new $58) car power supply, (new $48) 3 blank tapes (2 never opened), (new $20)
mini tri-pod, (new $27) wide angle lens telephoto lens. (new $142)
Purchase price $894, asking $425 for bundle. (Sold as package only)

-Pocket LCD Color TV (Radio Shack Pocketvision 30), 2.5" active-matrix for rich, high-resolution picture, digital tuning, telescoping rod antennae, built in speaker and jack for earphone. Has AV in jack (perfect for use with camcorder for playback instead of using eye-piece on camcorder). Sells new for $229.99, asking $150

ELECTRONICS
-DustDevil Plus vacuum and attachment kit. $25

-Car CD Changer, Pioneer 6 CD changer. Uses standard Pioneer CD magazines, comes with at least 3 magazines. Works great. Must have a Pioneer receiver made to control the changer. Asking $170.

-TV, B/W 13", works great. Clear picture. Older model. $20.

-TV, Color 15" RCA, great picture, very reliable, older model, works perfectly. $40

-Radio, receives AM/FM/TV, General Electric Model 7-2930B, earphone jack, uses 4 AA batteries or included wall cord. $15

-Radio, receives AM/FM/TV & Weather, Emerson Model PM3909, earphone jack, uses 4 C batteries or included wall cord. $18-TV, B/W 13". Works fine. $15.

-Antennae, cell phone, "On Window" 5 dB Gain Cellular by Mobile Mark (model OW-5-900). $5.

-Wire & circuit tracing system, Brady Pathfinder 12-A, Can identify 12 circuits at a time. Use simple procedure to eliminate time and cost of retracing when re-wiring provide extra margin of safety. for Perfect for tracing phone lines, auto wiring, antennae leads, much more. Works perfectly. Use imagination :) $50.

-Coffee Maker, Mr. Coffee 12 cup, black, very clean, with filters. $5

MISC
-Trailer, 4' wide x 8' long x 2.5' deep. In good condition, licensed, spare tire. $190.

-Coat, Original Australian Outback Oilskin Coat, Medium, black, New for $165, Asking $60.

-Flight suit, Military issue CWU-27P Polyamide high temperature resistant, sage green. Size 36-R. Great condition. New for $125, Asking $20.

-Remote Control Pickup, Nikko brand, custom military paint job. Looks great, runs perfect, needs no work. 2 channel full function remote 27mhz, low & high gear, two 7.2 Ni-cad batteries, quick charger. $40.

SOFTWARE
-PC Study Bible 1.7 for Windows on 3.5" disks with the following add-ons:
1. New Exhaustive Strong's Greek-Hebrew Dictionary and Englishman's Concordance, 2. Definitions from Thayer's Greek Lexicon and Brown-Driver-Briggs Hebrew Lexicon 3. Interlinear Bible
4. Living Bible 5. Treasury of Scripture Knowledge 6. Matthew Henry's Commentary 6. Bible Maps ....Asking $75 for bundle.
-Corel WordPerfect Suite 7 for Windows 95, 32-bit Office, Graphics & Internet Power. Corel WordPerfect &, Corel Quattro Pro 7, Corel Presentations 7, CorelFLOW, SideKick 95, AT&T WorldNet Service, Netscape Navigator 2.01, Dashboard 95, Envoy 7, 150 fonts, 10,000 clip-art images on one CD Rom, never opened. Sells for $298, asking $175.
-ECCO Pro 3.0, Personal Information Manager, calendar, phone book, dynamic notes, outlines, folders, "shooter," and more for Windows on 3.5" diskettes. $35
-Romantic Adventures, A practical and fun software package that will help you manage and improve your intimate relationships. Complete with romantic ideas, a journal for tracking, helpful hints. New for $58.01. Asking $15.
-Diet, Menu Planner for Windows on CD, $10
-Diet, Weight Loss Planner for Windows on CD, $10
-Diet, Executive Diet Helper for Windows on CD, $10
-Game, TerraNova "Strike Force Centauri" 1996, $18

JEWELRY
-Ring, USMC Diamond/Gold/Onyx men's, 10k & black onyx with 1/3 k. diamond, Jostens, lifetime warranty & re-sizing . (new $950) - $375.
-Watch, Military Field Watch, stainless steel, black face, quartz accurate, water resistant, web black band with leather uppers and lowers. Shows day and date with second hand. New for $89, asking $25.
-Watch, Swiss Army "Wenger S.A.K. Design" stainless body with white face and black leather band. Displays military hours, shows date, second hand. Water resistant 100 meters. New for $119. Lens is scratched. Asking $25.
-Pendant, Pewter Raven pendant, 1.25" round two-sided, hand carved. $15
-Pendant, Pewter Raven pendant, 1.5" round single-sided. $15
-Pendant, Pewter Raven pendant, .8" x 1.25" rectangular single-sided. $15
-Pendant, Pewter Raven pendant, 3.5" two-sided. $15
-Pendant, Silver 1" Raven holding .5" onyx marble pendant, single-sided. $15
-Pendant, Silver globe w brass continents chime pendant. (Chimes inside of ball). $18

POLICE/SECURITY/GUARD Equipment
[All duty gear is NEW and matched set of Nylok 950 Denier weave]
-Case, for cell phone, for duty belt, (for Motorola flip phone), foam padding and Velcro flap, uses "rip-offs" clip. (Paid $17) Asking $8.
-Flashlight, MagCharger flashlight (Made by Maglite), comes with AC & DC charging, five cell battery stick, high-powered halogen bulb for 30,000 CP, lifetime warranty, no scratches, no damage, new in box. (Paid $150) Asking $80.
-Jacket, Hidden Agenda Jacket, Supplex (tear resistant) Nylon Jacket has hide-away custom ID panels, looks like an ordinary black jacket, but simply reach up and pull down the hidden badge flaps (over right & left top pockets and on back). Panels are replaceable and can be customized. Size is 36-39. Great condition. (Paid $125) Asking $65.

CHRISTIAN MUSIC CD's: $6 each
-Johhny Q. Public "Extra-Ordinary"
-Grammatrain "Lonely House"
-Acappella "We Have Seen His Glory"
-Hosanna Music, "Glorificate" Praise in Spanish
-Julie Miller "He Walks Through Walls"-Glad "Floodgate"
-First Call "Sacred Journey"
-Darrell Mansfield "Get Ready" & "Give Him Your Blues"-Lanny Cordola's "Of Riffs and Symphonies"
-Lost Dogs "Scenic Route"
-Larry Howard's "Cornerstone Blues Jam"
-Bright Star Male Chorus "He Will Answer Prayer

Thanks for glancing through all this stuff. Everything is in good condition. I'm selling everything I can live without for student loans. Feel free to E-mail me at ron.in.seattle@pobox.com or leave a message at (206) 997-7871.
Thanks in advance.

>bridge.

The IC-738 already does have a built in SWR meter, it is accurate ICOM uses it
for the automatic power control feedback voltage.

>It is true, that the 738 does may not tune a "random wire" antenna.

The tuner is made for unbalance feedlines feeding antennas that have a maximum
impedance range of 16.7 to 150 ohms. generally this covers most dipoles,
traps, tri banders, and verticles.

3510. Re: WTB: Miracle Baby antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-28 00:00:00 UTC
From: dave@hip-hop.hh.sbay.org
Message-ID: <5028jo$din@moe.virtual.org>
Source record: 195077

I have all three - the Miracle Baby, the Maldol Active
Hunter, and the Diamond RH-3 "bullet". They are available
ar HRO (www.hamradio.com).

The Maldol works as well as any of my 8" or shorter rubber
ducks on 2m/440, including my TH-79's stock antenna - a real
surprise and I use it as my main antenna on my dual bander now,
in fact. I do notice that if I get my hand anywhere near the antenna
signals just go away - it's very sensitive to this. Someone else
mentioned this behavior in another post. But for the size, I am
happy with the performance.

The Miracle Baby is supposed to work on 2m/440/900 for TX and
a bunch of other bands for receive. On 2m it's not too hot - about
3 dB down from a standard 2m 1/4 wave duck. On 440 I have used it
to work local repeaters to good effect. I also tried it on 1.2 and
it doesn't work *at all*. A 10W 1.2 repeater 2 miles LOS right above
me on a mountain it cannot hear. For 900, I don't know - maybe it
actually works well there.

The Diamond RH-3 "bullet" says it'll TX on 144/430/1200. Note "430" -
the Japanese 430-440 ham band. The antenna performs about the same as
the Miracle Baby on 2m/440 (rather porrly) but it works nearly as well
as the stock (1/2 wave?) antenna on my 1.2 HT. Since I bought it for 1.2
I'm happy with it. This antenna is the smallest of the three, and looks
the most rugged.

In short, if you want to run primarily 2m/440, get the Maldol.
If you want 1.2, the Diamond RH-3 works decently.

Has anyone taken apart the M.B. or the Diamond RH-3? I wonder
what is inside the things. The M.B. makes a "springy" sound when
I tap on the outside.

73,

Dave WB9TMF

3511. Advise On Test Equipment Required

: to 6 meters? How well does it work, the radio's are pretty inexpensive!
: Thanks, any information on a conversion or performance would be
: appreciated.

I did see a conversion for the RS TRC-505 or 515? Somewhere on the web.
Unfortunately I can't find the reference in all the clutter at the moment.
This was for the single channel FM unit and was basically; re-crystal it,
re-tune it, you're on the air. Before I got to it I picked up a
tranverter from Ten-Tec for $95 and strapped it to my 2M all mode. More
modes and 8 watts instead of 100mW :) Search with TRC-505 and TRC-515
and you should come up with it. Or, search for Ten-Tec :>

Try wrapping an appropriate amount of fine-gauge wire around
the old resistor form, or around a 2-watt carbon resistor of any value.

The ARRL handbook has resistance/foot for common sizes of wire.

>
>73, Dick

Problem is, the box has holes in the end with a current carrying conductor
, hi.. To avoid that, you need to ground the shield. If you ground one
end, it adds capacitance and shields the wire a bit at the ground point.
If you ground both ends real well, it really shields the entire wire. If
you don't ground the shield, it can make things worse (and DON'T touch the
shield if that is the case).

On my Diesel engine, Ford shielded and grounded the injector solenoid
wires only at the EEC module. I had 20 over 9 noise until I grounded the
shield ends at each injector solenoid.

The TITAN is no longer in production. They are making a gold
plate run as a last call for $3375 a copy. They expect the run
to be over by November.

I've used Henry amps to great success. They are built like a
battleship. You get your money's worth with these amps.

Another amp to check out is the ETO 94B. This amp is being
sold by ETO for $2500. It is a clone of the 97A. The only
difference it it uses vacuum relay instead of PIN diodes for
changer over, and uses the Svetlanda 4cx800 tubes instead of
the 3cx800 tubes. Same ETO quality though and appears to be a
"best buy" at this time.

You can make a low ohm resistor, but
if you really care about what the resistance is, you'd better use
some stable resistance wire and make a 4-terminal connection.
I've used brass strip. Make a kelvin connection and file down
the width till the value gets up to what you want. The strip has more
surface area per volume and doesn't get as hot so it's more stable...
but still crummy.

Last changed: October 30, 1995 |

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

TABLE 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

TABLE 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. | Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. | Repair service for the Plectron P1 and R700 models is | offered by:

Woodson Electronics |
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. *

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

>please respond here or by e-mail gvang@seine.com

Gene,

In the ICOM 740 ALL of the Transmit IF signal goes through the Compressor switch. So if the compressor switch is faulty so goes the transmiter power. Since you mentioned it has some output when the compressor is engauged, I think there is your problem. The 740 also requires a preamplified mic, you need to have a HM-7, HM-8 HM-10 SM-5 or SM-8 for proper operation of the radio. Below are some other hints to faults and cures on the ICOM 740.

Gary

Most Common Failures and Cures for the Icom IC-740

Symptom: Distorted RX/TX, or no RX/TX on one or more bands.
Distorted SSB audio sounds raspy and rough. Problem may be
temperature related.
Probable Causes: 1) Bad trimmer capacitors on PLL unit, HPL
VCO section.
Cure: Replace plastic trimmer capacitors C4, C15, C24, and
C33 with ceramic equivalents..

Symptom: Any of the following: 1) No RX/TX at all.
Display normal. 2) No CW operation. 3) Some front panel
controls do not operate reliably. 4. Or Just plain weird troubles.
Probable Cause: Burned or open on R1 on reg. unit.
Cure: Replace R1 (4.7 ohm, 1/2 watt).

Symptom: Intermittent no/low TX output. Jiggling or
pressing the compressor switch causes the power to return to
normal.
Probable Cause: Bad compressor switch. (This is a common
failure in the IC-740.)
Cure: Replace (do not clean) the compressor switch.

Symptom: Low, erratic TX output in all modes. (Compressor
switch has already been replaced.) ALC meter reading is

unsteady and may drop out altogether. Removing the top cover may cause problem to disappear for a while. Pressing on the wiring harness near the IF unit may cause the power/ALC meter reading to fluctuate. Problem may be temperature related.
Probable Causes: 1) Poor solder joints on IF unit. 2) Dirty RF power/mic gain pot. 3) Poor connections at IF unit is causing low TX drive. This is sometimes caused by oxidation at the point where the wires is crimped to the connector pins. 4) Bad relay on FM unit (if installed).
Cure: Clean dirty RF power/mic gain pot. Resolder cracked and suspicious-looking joints on IF unit. If these do not help, remove and resolder the wire crimps in the RF connector pins in J2, J5, J12, J9, J19 and J20 on the IF unit. Be sure to not add too much solder to the connector pins or they will need to be replaced. Be sure all connectors are fully seated after repair. Replace RL1 on the FM unit.
Remarks: Although resoldering the connector pins is a delicate and time consuming procedure, it will save you a great deal of troubleshooting time and frustration.

Symptom: TX power output is marginal on some bands. (Compressor switch has already been replaced.) ALC meter reading is low and steady, not erratic. Adjusting ALC pot does not increase power. Troubleshooting reveals that no specific stage is malfunctioning
Probable Cause: TX IF needs to be aligned.
Cure: Set unit to 14.100, TX in RTTY mode, and adjust L8, L10 and L11 on IF unit for peak ALC meter reading.
Remarks: If the above steps have no effect, troubleshoot for a defective TX stage, or follow steps for curing erratic TX.

Symptom: Power gradually drops off when warm. ALC meter indication remains at mid-scale. Adjusting ALC does not help.
Probable Cause: APC misalignment.
Cure: Realign ALC, Ic METER, and APC as per pages 9-1 and 9-2 in the service manual.

Symptom: VFO tuning is erratic, sometimes skips when changing frequencies or bands. Displayed frequency sometimes does not increment smoothly when VFO knob is turned slowly.
Probable Causes: Dirty rotary encoder.
Cure: Remove white plastic cover from back of rotary encoder and spray clean the carbon track with Blue Showers solvent. Spin VFO knob vigorously while spraying.
Remarks: When cleaning the rotary encoder, do not let solvent saturate the display unit or allow it to come into

contact with the plastic display lens. Stuff a paper towel between the rotary encoder and display unit to catch spray run-off.

Symptom: Unit jumps frequency unexpectedly when turning VFO knob. Digital display does not track with this jump. The frequency jump is consistent and happens in the same place every time. Actual operating frequency and displayed frequency do not match in some parts of the bands.
Probable Cause: PLL is out of alignment.
Cure: Be sure you don't have a rotary encoder problem, first. Try realigning the LDO as per the second "9-1" page in the service manual. If this doesn't help, follow the complete alignment procedures for the PLL on both "9-1" pages in the service manual with the exception of the PLL Lock adjustment.
Remarks: We do not recommend adjusting PLL Lock trimmers C4, C15, C24 and C33. They do not contribute this particular problem and disturbing them may cause them to fail.

Symptom: Frequency instability.
Probable Causes: Dirty RIT/XIT pot and switches.
Cure: Clean dirty RIT/XIT pots and switches with Blue Showers solvent.

Symptom: Drastic change in audio frequency response between USB and LSB., i.e. USB audio has too much bass while LSB audio has too much treble. TX frequency response is also poor.
Probable Causes: Misadjustment of the BFO, PBT oscillator.
Cure: Align the BFO and PBT oscillator as per page 9-4 of the service manual.

Symptom: Intermittent low FM TX output power.
Probable Cause: Poor contacts in relay RL1 on FM unit.
Cure: Replace bad RL1 (221B-D009-M)

Symptom: Distorted/raspy-sounding SSB TX. Complaints of RFI. Unit tests fine on dummy load. Unit is being used with an external Astron power supply.
Probable Causes: 1) In adequate station ground. 2) External Astron power supply needs additional RF decoupling.
Cure: Recheck station ground. Improve if necessary. Install additional RF decoupling capacitors on Astron power supply.

Symptom: TX oscillations or low, spurious output, especially on lower bands at lower power levels. SWR reading may be high when transmitting into a dummy load.
Probable Causes: 1) Bad Q10 on RF unit. 2) Bad electrolytic capacitors on PA unit. 3) Band switch has been mis-aligned. 4) Burned components on the ANT SW unit.

5) Bad drivers or PA transistors.
Cure: Disconnect J9 on the RF unit and see if the problem goes away. If it does, then Q10 is most likely bad (replace it with a 2SC2878B). If disconnecting J9 has no effect, examine the PA unit. Replace C18 and/or C24 on PA unit if they appear swollen or overheated. Check the ANT SW unit for burned components and replace as needed. Check alignment of the bandswitch wafers and correct if necessary. If none of the above are causing the problem, then most likely the drivers or PA transistors are bad.

Symptom: Erratic display i.e., frequency listed will be out of the normal operating range of the radio. Rotating the VFO knob may cause strange characters to appear in the display. Radio does not work properly. Cycling the power switch a few times may restore operation temporarily, or radio may be stuck in the failure mode.
Probable Cause: 1) CPU is glitched and must be reset. 2) Loose connector on logic or matrix unit. 3) Bad diode on matrix unit.
Cure: Turn-off memory back-up switch on rear panel of radio and leave radio unplugged for a few minutes or so to reset CPU. (It is recommended that the switch be left to the OFF position to prevent future failure.) Re-seat all connectors on logic and matrix unit. If none of these solve the problem, there may be a bad diode on the matrix unit.

Symptom: Either of the following: 1) Preamp does not work. Sensitivity of radio drops when preamp is engaged. 2) RX noisy and intermittent. Preamp intermittent.
Probable Causes: 1) Bad preamp relay on RF unit. 2) Burned components in preamp section on RF unit. 3) Cracked solder on RF unit in preamp section.
Cure: Replace bad RL1 (FBR221DO12). Replace bad/burned preamp components on RF unit, usually RL1, Q11, Q12, R58, C86, etc... Also check Q10 for failure. If bad, replace it with a 2SC2878B. Carefully examine the preamp section of the RF unit for bad joints and resolder as needed.

Hi Lee,
In article <32233787.4826369@news.alt.net>, lwhiting@stic.net (-=DR DX=-)
writes:
>
>First of all, Tom, if you will read Mike's original post, you will see
>that he is asking for info. I am merely passing on some. No one is
>selling anything or advertising anything for sell. The spec's are
>merely for comparison to other amps of this type. Probably right
>about it not being certified, but then neither is the Palomar that
>Mike mentions.

I was just making an observation. My point was if the amplifier was
illegally marketed, the company obviously does not care about important
laws. If they don't care about important laws, they probably don't care
about less important laws. It's kind of like asking a drug dealer the
percentage of Heroin in his product, or buying a Rolex watch at a bus
station.

Anyway, I was wondering if the amp was a CB amp, I never heard of one
before. If it was (and it seems like it is) a CB amp, most of the info
supplied with it is probably just made up. It probably has less than
proper design for use on Ham bands.

>>>IMD: -33dB

>Actually, it is based upon single tone output @ 14.2 MHz.

A single tone can not be used to measure IMD. The test must have at least
two equal "tones", and they should tell if the measurement method is
against PEP or one tone of the two tones.

Preamp?
>Where have you been lately?

I was at the racetrack yesterday, thanks for asking.

>Check out any Icom HF rig that has been
>made lately and you will find a button labeled "PREAMP" or in the case
>of the IC-706, "P.AMP". Yeasu also has a HF rig or two that has one
>as Bill noted in his reply to your post.

I've never seen an HF Ham **amplifer** with a pre-amp for RX, that made me
wonder if it was really a Ham amp....that's all.

>>>Electronic Input Attenuator
>>
>>What is it, PIN diodes? Is it variable? If it is not variable, why is it

>>electronic?
>
>It does not use PIN diodes and it is variable. It does not use the
>standard resistor network that most amps of this type use to attenuate
>the input signal. It uses a series of inductors and diodes.

If it doesn't use PIN diodes, it will have severe distortion in the diode attenuator. Inductors don't make good attenuators either. They are non-linear with frequency, and add more reactance than loss.

>No Tom, Mike was asking for info about a RF amp for HF
>
>>or high low power?
>
>BINGO!

I wondered what type of amp it was, and what it was really designed for. I guess it's a CB amp. I've never seen a Ham amp with high and low power input ports.

73 Tom

3546. Suggestions on HF Radio purchase

3549. Grounding Shields

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-28 00:00:00 UTC
From: Dick Flanagan <dick@merlin.libelle.com>
Message-ID: <322471CE.5D6A@merlin.libelle.com>
Source record: 195157

Here is a very basic question I should know the answer to, but obviously don't: if I place coaxial braid over automobile ignition plug wires in order to reduce the radiation of broadband RF interference, will it be necessary to bond those shields to the engine ground? Or will the shields be able to provide adequate shielding by simply "floating" on the outside of the plug wires?

My first intuition is to say the shields need to be grounded, but then I am reminded of the lead box in space that shields its contents just as well as it would if connected to an earth ground.

Apples and oranges? Any insight would be appreciated.

>Well I wouldnt call it a "flaw"...I think what you mean is "unacceptable". And
>it should be noted, that referes to you...not necessarily anyone else.

I don't want to argue semantics. Sure, you can say that your radio
isn't flawed, it just isn't as good as that Dana Myers says it should
be, but that's just Dana Myers for you. If that makes you feel
better, fine. The fact is, a TXD of 250mS on 9600 is a flaw, and that
isn't just my opinion.

>>250mS? I won't use a radio that requires that much
>>TXD on 1k2.
>
>Fine...again...those are your standards, and you should be comended for keeping

>bps.

Most folks? Most folks I know are using less than 70mS. Maybe most
folks you know are using flawed radios, too. 50mS TXD for 9600 baud
is not a high standard.

>>The problem is that a radio with that much delay

>rigs set at 50ms.

Of course collisions can happen with rigs set at 50mS. In fact, collisions
can happen with rigs that have a TXD of under 5mS. The probability of
a collision is increased with increased transmit delay time.

>>Also, the receiver recovery time means that you'll probably miss
>>rapid replies, they'll timeout and retry before you get the
>>frame.
>
>True, but I have not experienced that problem. Granted there are not a lot of
>users on 9.6k in our area, but all of my operation has been solid, with no
>retries.

Well, if everyone in your area is running 250-300mS TXD, I doubt you'll
see replies quickly enough for your receiver to miss them. How
do you actually know your operation has been solid with no retries
by other stations?

>>This won't happen if other stations are
>>running similarly>long TXDs, but then you're really throwing away the 9k6
>>advantage>(a 256 byte frame doesn't take much more than 250mS to send; so
>>a TXD of 250mS represents a loss of 50% of potential throughput).

>large block per transmission/reception. I can collect (and send) a full
>paragraph per transmission. The difference between 1200 and 9.6 on my station
>is obvious.

Sure, using large block sizes reduces the overhead. Using a radio
with an appropriate TXD is even better. Radios slow to key up
on frequency increase the odds of collision, and the longer frames
increase the impact of a collision when it happens.

>>Um, save up your cash (under $150 for a clean Mitrek and rocks) and get

You're taking this far too personally. Did I criticize you? No. I
pointed out some of the problems with using a PLL radio for 9600 baud.

The Pro-39 is another excellent scanner that can be unblocked for cell.
The mod is more difficult on the Pro-39 than on Bearcats, but the sound
quality is much better.

I recently replaced the front cover of an Alinco 580t. After reassembly I noticed that the unit (particulary the top) heated up. I rechecked all connections and made sure that everything was tight. Performance seems unaffected. Does anyone have any idea why the HT heats up after 15 seconds of "key". Is there something I'm overlooking?

I have owned this particular radio for about five years, and I have had
this problem twice. What you have to do is reset the cpu, it tells you
how to do this in the manual. after you reset then you will have to
reprogram all your frequencies. Let me know if this helps. 73 KB9DVM

>
>Can anyone recommend a brand of 70cm radio from any of the major
>ham-radio manufacturers that is really suitable for 9600 baud packet? I
>wonder if there are any PLL sets that are satisfactory?

There is *one*, Tony. It is the Azden PCS9600D. However, I can't
recomend it since Azden has a horrible reputation for poor reliability
and lack of factory support. The Icom IC820H almost makes it, but the
receive filters are too narrow. If you can fit wider filters, it may
suffice. (It's not that 9600 is wide, it is just that filters are phase
non-linear near the passband edges and that distorts the signal and
closes the eye. The cheap way to fix that is to use a wider filter so
the signal doesn't approach the passband edges. The expensive way is
with an adaptive equalizer.)

Otherwise I suggest you stick with a crystal controlled data radio
like the TEKK KS900. It works fine, and costs very little (under
$150 crystalled to your frequency). It is rare to need frequency
agility in a data radio anyway. The proper way to configure a
network leaves your radio on a single known frequency 7x24 so
that the network routing software knows where to find it when
there is traffic for your station.

<snip>

Marty,

I've used the headsets from Nady's wired rider/passenger intercom. has
a flat speaker (about 1/4" thick) that slips between your ear and the helmet foam.
You can velcro it in, but I never bothered. From this, there's a flexible boom
with the mic on the end. Foam wind screen on the mic. 3 terminal
mini-stereo plug connection; mic, spkr, common ground. I wired an adapter to go to
my FT530, and also to put a paddle switch above the clutch lever for PTT. I connected
a small 2.2K pot for use as both the PTT resistor, and to try and trim mic gain. Top
of pot to HT, wiper to microphone, bottom of pot to PTT switch, other side of PTT
switch to ground. The pot may not be needed; I did it that way as an in case kind of
thing. With the PTT switch as connected, VOX is theoretically possible, but I
didn't trust wind noise or myself yelling epithets at stupid cage drivers, so I never
tried that.

Works pretty well. I've had good audio reports as long as I talk softly.
(The mic is pressed against my lips in my helmet; easily overdriven.) No complaints
of wind noise; many were surprised to hear I was on a motorcycle. Audio output
is okay; I need to buy a new helmet however, as wind noise is a problem. If you have
a quiet helmet or touring bike with big windsheild, I doubt this will be a problem
for you; I have an 8yr old Shoie GRV and a BMW K75S.

Headset is available for about $25 or so; I've seen ads in the various bike
rags, I think it was Cycle World. Local dealer may have the whole intercom if you want
a look, or JC Whitney has them (I had the intercom long before my ham license, so I
just tried it and it worked okay.)

If you can't find a place to buy, EMail and I'll look up the ad, or even fax
you a copy if needed.

Good luck.

>> just become a fuse. Sure it is 0.05 ohm? The smallest one I can find
>> in either the Mouser or Digi-Key catalog is 0.1 (but of course you can
>> parallel two of those...)

There have been many suggestions about winding my own resistor but
all don't take into account the current that must be handled.

The power supply is rated at 35 amp intermittent/30 amp
continuous. 35/4= about 9 amps. The voltage drop would be about
9 * .05 or .45 volt. The wattage would be .45 * 9 or about 4 watts.

That's assuming that the current is equally distributed.

Note also that I received a number of responses that indicated that
others have replaced the resistors. The resistors also act as fuses.

There is some extra room but a 5w 5% resistor is a pretty small package.
Winding number 10 wire won't make it, hi hi.

Question on nichrome:

Can anyone comment as to if nichrome wire would be an effective way
of making the resistor? Is nichrome wire stable enough over the
current ratings which are expected? Is it going to stay within 5%
of 0.05 ohms whether at 1 amp or 9 amps?

<snipped disparaging comment from Big Don>

If you have your schematic and the assembly drawings, etc., you'll notice the "filter board". If I remember correctly, this limits the receive and transmit bandwidths to the amateur bands, with a little slop off the ends for MARS, etc.

I suppose you could rewind the inductors and put new caps in to cause the "bands" to overlap, however this may have drawbacks in the form of reduced gain (especially noticeable on receive, where the radio is too weak already) and possibly worse rejection of out of band stuff (intermodulation?).

I have a 5400 and have enjoyed using it for almost 11 years. It is not my primary HF rig though. I had used it as a mobile rig for a couple of years and it was fine in that capacity (i.e., the weak RX overall gain wasn't bothered too much by ignition noise).

If you want to correspond about the 5400, please leave me e-mail at mzilmer@deltanet.com.

Source record: 195027

On warm days the radio's display flashes between digits and decimal points. I understand this indicates PLL unlock. Other times the digits don't flash but the displayed frequency has to be continually increased to hear the same transmitting station. Often the audio is distored. These problems show up in different combinations and on all bands.

I would appreciate contact with anyone that has had these problems with their machine.

Subject: FT-900 Frequency Expansion Information

Yaesu U.S.A.
Amateur Products Division
Technical Support

Model: FT-900
Date: 24 August 1994

Original Freq. Range: 160-10M (Ham)
New Freq. Range: 1.8-29.99MHx TX

Important Notice Regarding Disclosure
Restrictions

This information is autorized for distribution only to
individuals who are members of the U.S. Military Affiliate
Radio System, Civil Air Patrol, or other government services
specifically permitted by the FCC to use non-type accepted
equipment such as that utilized in the Amateur Radio Service.
Release of this information to individuals not bearing a
license in the MARS, CAP, or other such service is not
authorized by Yaesu USA.

1. Remove the two screws from the top cover, and the two
screws from the top rear area of the rear panel, so as to
allow the top cover/heat sink to be slid slightly toward
the rear. The objective is to be able to see into the

CNTL-1 Unit, which is the inside part of the front panel
(not the detachable sub-panel).

2. Locate test points TP3001 and TP3002 on the CNTL Unit.
They are located near the top edge of the board, in the
center from left to right. With the transceiver still
turned off, connect a jumper (alligator clip is ok)
between these 2 test points.

3. Hold in the following 4 buttons: [PROC], [ATT], [IPO],
and [NB]. While holding them in, turn the transceiver on.
Release the buttons.

4. The display will indicate OFF.
Turn the VFO dial slowly until the display reads ON.

5. Press the [PROC] button to write the new instructions
to EEPROM.

6. Remove the jumper across the test points.

7. Replace the case screws. Mod is now complete.

I'm sorry, I got the info you need from this newsgroup one month ago....
so I wrongly supposed it was already known to all !

When you are in the special menu mode (switching on the radio with
VOL-UP, VOL-DWN and CALL pressed) you have only to press F key for more
than a second.
After that you will see the usual "flashing F" on the display and you
are allowed to change the selected parameter with the MHZ-UP, MHZ-DWN
buttons.

To select which parameter to change you have to use the DIAL KNOB (when
the flashing F in not diplayed!)

The last thing, I have discovered yesterday night, was about the BAND
parameter change: to be allowed to do it you have to change the internal
jumper configuration
from:
(euro version) JP4, JP5, JP6 closed; all the others open
to:
(again euro version) JP1, JP5, JP6 closed; all the others open.

I'm sorry but I have not investigated about the equivalent USA
version...

If you need to know how to change the jumpers you may refer to the
normal MARS/CAP modification description available on many sites
(ftp.qrz.com ...);
anyway be sure to have the proper skill before to start.

==========
The last but most important thing!
Check what you can or cannot do in YOUR country before to use the
modified radio !
In the majority of the countries are ILLEGAL not only to transmit but
ALSO to RECEIVE outside the ham bands.
==========

Try buying some "resistor wire" or Nichrome wire, with a known
ohms/ft. rating in an appropriate diameter for your power
requirements, and then "roll your own" on a resistor for a body.

The wire is more readily available at scientific supply houses than
electronics distributors nowdays.

Hello,
I was wondering if anyone has a Opto Scout (Freq Counter) for sale? If you have a older version Scout thats fine also. I just am in need for one of this units cause we are moving soon and it will come in handy to find all the new frequencies in the new location.

So, if you have one that you don't use and you might want to depart from it. I
will gladly buy it from you!

Email me N9MXT - Jeffrey

I have a TR-2600, and I was interested in knowing why it always had a
'click' on the transmitted audio at keyup time. I noticed the click
was audible on nearby frequencies, too, and suspected the PLL
settling was to blame.

So, I connected the discriminator output of a test receiver to a scope
and tuned it 100KHz away from the HT's transmit frequency. Guess what?
I could clearly see the HT sweeping through the passband on key-up.

So I tuned 200KHz away. Same thing.

I estimated the HT was swinging about 300KHz on the initial overshoot.

That's a lot.

Interestingly enough, the PLL in the TR-2600 does have a lock detect -
it just isn't very picky about how locked the PLL is. It is really there
to avoid transmitting when the PLL is completely failed.

The sweeping PLL plagues most early PLL radios. We have a documented
case in New England where a TR-2400 (early Kenwood PLL handheld) trashed
a node 20 miles away every time it transmitted. I have seen a PLL sweep
across a channel 300 KHz away 3 times during the pre-lock period.
Fortunately most modern PLL radios do not transmit until the PLL is
locked. That creates another problem. When a radio has a delayed power
out period, nobody else on the channel will know that it has started it
TX sequence. Result a collision, either yours or somebody else's. Read
my article on "Key-up HTS" at http://www.cam.org/~dino/neda/HTSDUAL.html

>
> With the deviation set correctly (3.0), it does not sweep outside the 5khz
> limit,

Deviation is not the problem, it is the PLL sweeping across the band before locking up. Such a moving signal if it is being transmitted at significant power will punch holes into frames on any channel within RF range. It only takes 0.1 ms of hole to completely trash a frame. See above for documented case.

> but I agree that "long" TXDs affect channel effeciency.

They sure do. What is the point of sending 250 ms of flags and a 15 ms ACK frame? That is a lot longer than a 20 ms TXD "fast" rig with a 120 ms ACK frame at 1200 bps. I suppose if you send a long enough TXD period then everyone else will have given up and you have a clear shot at the channel. :-)

>
> >You share the channel with everyone else, so you should be considerate.
>
> I run the same TXD as most users on the freq.

You should be running the minimum TXD that your radio and the radio at the other end of the link require. That would reduce the surplus flags being sent on the channel and reduce the chance of a collision with a HTS station.

BTW the Flexnet system being used in Europe has an interesting feature. The node measures the length of TXD transmission it can hear from you and if it hears more than 100 ms it will send you a msg indicating you have your TXD set too high. It then refuses further data from you. You only need enough flags so that the station at the other end of your link can catch the start of the data frame.

> >>Other than that...I like it very much, and it works well.

Ignorance is Bliss!!!! And no excuse for running inadequite radios on the network.

>
> >You have not tested it. How would you know?

For test methods to check switching speed of radios, try http://www.rocler.qc.ca/burt/drstm.html

>
> It works well in the regard of solid connects, and no retries with other
> stations, and when on the 9.6k repeater, results are the same.

Anyone who says that he has NO collisions on a channel must either:
A/ Be transmitting UNPROTO frame alone on the channel or
B/ Be so strong into the server that he overrides everyone else on the channel or
C/ Would not know a collision if it hit him in broad daylight in the middle of the highway.

Any communications involving 2 or more stations on a CSMA channel will encounter collisions. Just like the only 2 cars registered in the whole

state of Ohio in 1905 that had a collision one day. I presume that you mean you have very few collisions. If so, say it. Give it some numbers like 5%, 10% or whatever. More likely if you are not having collisions then others on the channel are due to your signal.

>>Kenwood just doesn't happen to be one of them.
>
>My Kenwood is running right now...as we speak...at 9.6k. :)

I've never claimed that your Kenwood can't spew bits at 9600 baud.
What I've claimed is that your Kenwood is not suitable for 9600 baud
operation because of the excessively long TXD value you claim to use.

>>>BTW, that was the setting for duplex operation. I can run 100ms in simplex.
>
>>Are you saying there's a local duplex repeater that requires an
>>extra 150mS of TXD? That repeater is quite broken.
>
>No.

You've said you use 250mS TXD when operating through a duplex repeater, but
that you only use 100mS in simplex operation. Why do you use the longer
TXD when operating via a repeater?

>
>>Um, if that repeater you're using requires 150mS of extra TXD, it
>>is flawed.
>
>Er...I dont know where you got this idea.

I can do math - you said "250mS on the repeater, 100mS on simplex".

250-100 = 150.

>>>That may be true, but the average TXD in my neck of the woods is much higher.
>
>>In other words, most everyone you know is using flawed radios and
>>doesn't realize (or accept) it.
>
>No. And Im not sure why you continue to make rash assumptions.

You've said you use a TXD of 250mS and that everyone else uses a similar
TXD. That's broken at 9600 baud.

>>That doesn't change the fact - these
>>people are using excessive TXD.
>
>As always...your opinion is welcome Dana. :)

It isn't just my opinion, Chris. Ask someone like Kantor or Janssen
or Coffman (you know, other people with networking and packet experience).
The answer won't be that different.

I own a TM-733a which had a similar problem. However my finals did not go bad. There is a single driver transistor which tells both power amplifier modules what power level they are to operate at. If this driver transistor goes bad as mine did your left with exciter power of maybe 10 mW (check your radio, it may be actually transmitting only exciter power). This part is replaceable at home if your'e willing and the radio is out of warranty. This is of course the 733 I'm talking about but I bet the 732 is very similar.

Now, Hi Tim KF9WX nice to meet you

From Tim KF8XW...Hmmmn

I like yours better

Hi !

I have an TS-440SAT for sale. all Filters biuld in.
Price DM2100

3599. FS; R-2000 & TNC

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-29 00:00:00 UTC
From: otaku@atl.mindspring.com
Message-ID: <502ppm$1bp0@mule0.mindspring.com>
Source record: 195108

Courtesy of Blue Cross HMO and rising medical bills. I am forced to
sale a couple of items that at the current time are classified as
luxury
items. Any help in selling these items would be greatly appreciated.

Short-wave Receiver
Kenwood R-2000
This radio is in like new condition.
Covers from 500Khz to 30Mhz
in AM/FM/USB/LSB & CW modes.
This unit is complete with all manuals
an accessory items still in plastic bag.
In original box and the original shipping box.
$525

MFJ-1278 Multi-mode Data Controller
Will handle the following modes;
Packet/Amtor-FEC/RTTY/ASCII
CW/FAX/SSTV/Navtex/Memory Keyer
This unit is also like NEW, and has all
manuals and comes with IBM software
package. Also includes the firmware
upgrade certificate. In original box.
$225

As stated above, these items are both like new and if it were
not for the pending medical bills, I would not be selling either
one of these, as they are really great. I would prefer someone
from the Atlanta area, as they can then take a look at it, spin
the dials push the buttons an so forth, so they feel comfortable
buying the items and can see what they are getting for there
money. Anyway! Thanks for the space and if your interested
in either item, please drop me a line.

otaku@mindspring.com (aka;William Hogan)

p.s. If it makes any difference, both items were purchased
from The Ham Radio Outlet here in Atlanta.

3600. Re: PLL Radio for 9600 baud packet?

>isn't flawed, it just isn't as good as that Dana Myers says it should
>be, but that's just Dana Myers for you. If that makes you feel
>better, fine. The fact is, a TXD of 250mS on 9600 is a flaw, and that
>isn't just my opinion.

I disagree. I just dont agree with your teminology I guess. I would say
that ny setup works flawlessly with its given settings. Now those SETTING
may be "unaceptable" to you (and others), but I was simply answering the
persons question...which is YES...there ARE PLL radio that will work at
9.6k.

BTW, that was the setting for duplex operation. I can run 100ms in simplex.

>Most folks? Most folks I know are using less than 70mS. Maybe most
>folks you know are using flawed radios, too.

No...I know of no one on packet that is useing a flawed radio.

>50mS TXD for 9600 baud
>is not a high standard.

That may be true, but the average TXD in my neck of the woods is much higher.

>Well, if everyone in your area is running 250-300mS TXD, I doubt you'll
>see replies quickly enough for your receiver to miss them. How
>do you actually know your operation has been solid with no retries
>by other stations?

By monitoring the frequency of course.

>You're taking this far too personally. Did I criticize you?

Did I say you did? :)

>No. I
>pointed out some of the problems with using a PLL radio for 9600 baud.

And I answered the guys question which was "...if there are any PLL sets
that are satisfactory?" The answer was yes...and I also added some information
and settings so he could get the whole picture, as not to cloud the issue.

Take care Dana, and thanks for the feedback.

From: "R. John Glackin" <jglackin@bev.net>
Message-ID: <32259919.2A2B@bev.net>
Source record: 195110

For Sale to best offer:

Yaesu FT-747GX 200W HF Transceiver w/mic,docs,etc
Astron RS-35M 35 Amp Power Supply
Yaesu FIF 232C CAT Interface

All of it was taken out of the box, setup for a few days, and put back in the box a few years ago. It has been stored since then. I pulled it out the other day and decided I should sell it to someone who would use it. It is in mint condition and works perfectly with all original docs,boxes, etc. The whole thing originally cost just over $1000.

Would be great for a new or old Ham. Just add antenna!

John Glackin

Hello Rob.

>"I have not tested it but it runs flawlessly". This is the comment that
>you see from many commercial-FM-transceiver 9k6 users. Often referring
>to a claim from others that it is inadequate.

>However, please not that the vast majority of people who DID test it, will
>tell you it IS inadequate.

"Inadequate" in what way?

>>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>>freq...and vice versa.

>That downside would be sufficient for me not to buy it. And it should
>be for you as well.

Well...I certainly wouldnt pass judgement on others what to buy, but lets not
forget...everyone has to start somewhere.

>You are causing QRM on nearby channels with that sweeping transmitter
>(which is a design problem that plagues ALL Kenwood TM-[2345][34]1
>transceivers), and the long TXDELAY cuts into the efficiency of the
>channel.

With the deviation set correctly (3.0), it does not sweep outside the 5khz
limit, but I agree that "long" TXDs affect channel effeciency.

>You share the channel with everyone else, so you should be considerate.

I run the same TXD as most users on the freq.

>>Other than that...I like it very much, and it works well.

>You have not tested it. How would you know?

It works well in the regard of solid connects, and no retries with other
stations, and when on the 9.6k repeater, results are the same.

Take care Rob.

>9.6k.

Sure, there ARE PLL radios that are acceptable for 9600 baud. Your
Kenwood just doesn't happen to be one of them.

A short analogy:

If you had a car that could only maintain a top speed of 35MPH, would
it be a good idea to driver on the 70MPH interstate? I guess if
everyone is driving 35MPH on the interstate, it wouldn't matter.

>BTW, that was the setting for duplex operation. I can run 100ms in simplex.

Are you saying there's a local duplex repeater that requires an
extra 150mS of TXD? That repeater is quite broken.

>>Most folks? Most folks I know are using less than 70mS. Maybe most
>>folks you know are using flawed radios, too.
>
>No...I know of no one on packet that is useing a flawed radio.

Um, if that repeater you're using requires 150mS of extra TXD, it
is flawed.

>>50mS TXD for 9600 baud
>>is not a high standard.
>
>That may be true, but the average TXD in my neck of the woods is much higher.

In other words, most everyone you know is using flawed radios and
doesn't realize (or accept) it. That doesn't change the fact - these

people are using excessive TXD.

>>Well, if everyone in your area is running 250-300mS TXD, I doubt you'll
>>see replies quickly enough for your receiver to miss them. How
>>do you actually know your operation has been solid with no retries
>>by other stations?
>
>By monitoring the frequency of course.

Which receiver are you using to monitor the frequency? Do you have
a separate receiver set up with monitoring software (like AXMON?).
You can't use your station receiver for this kind of monitoring
since it won't hear the packets being dropped that are later
retried.

>>No. I
>>pointed out some of the problems with using a PLL radio for 9600 baud.
>
>And I answered the guys question which was "...if there are any PLL sets
>that are satisfactory?" The answer was yes...and I also added some information
>and settings so he could get the whole picture, as not to cloud the issue.

There are PLL radios that are satisfactory, but then you added some
information and settings which clearly indicated the one you're using
is *not* satisfactory but you use it anyway. Then you explained that
everyone else in your area is using unsatisfactory radios.

Er...I dont know where you got this idea.

>>That may be true, but the average TXD in my neck of the woods is much higher.

>In other words, most everyone you know is using flawed radios and
>doesn't realize (or accept) it.

No. And Im not sure why you continue to make rash assumptions.

>That doesn't change the fact - these
>people are using excessive TXD.

As always...your opinion is welcome Dana. :)

>>By monitoring the frequency of course.

>Which receiver are you using to monitor the frequency?

A seperate stand alone unit.

>Do you have
>a separate receiver set up with monitoring software (like AXMON?).
>You can't use your station receiver for this kind of monitoring
>since it won't hear the packets being dropped that are later
>retried.

I know that.

>There are PLL radios that are satisfactory, but then you added some
>information and settings which clearly indicated the one you're using
>is *not* satisfactory but you use it anyway.

Like I said Dana...its running right now, and communicates at 9.6k with no retries, and solid connects. I suppose if you want to label that "*not* satisfactory"...that is fine. :)

>Then you explained that
>everyone else in your area is using unsatisfactory radios.

Um...again...I never said that. You must be confusing me with someone else...no problem tho.

Thanks again Dana, and take care.

Sad to say, my friend, but the best generator I've used to date is any of several Honda products. My line of work is field testing of high voltage equipment and I require a stable AC source for my equipment. The Hondas provide this very effectively. They are well made, easy to maintain and easy to operate. I have rented several other brands from contractor rental services, with varying results. Now, I don't rent if it ain't Honda.

From: floydjr@interpath.com
Message-ID: <5078op$kmm@redstone.interpath.net>
Source record: 194975

I ordered a 20-4CD 4 element 20 mtr monobander from Texas towers on 08/05/96.
I still do not have the antenna. I called Texas Towers and they said that Cushcraft
had not shipped it yet. It would be another week before they did.

My question is does it take over a month to ship a simple monobander? I have
70' of tower, base in ground and everything ready to go up waiting on this antenna.
Also have a Hygain 5 element 15 monobander together and ready to go. BTW
took less than a week for it to get here. I have secheduled my help to do all this
for the second Sat in Sept. I need of course to put this antenna together and set
it.

I was curious if anyone else had ran into this. I understand the Mosely does not
make an antenna until they have enough for a run. I hope it is not that way with
Cushcraft. I really enjoy contesting and the first RTTY contest is the last weekend
in Sept. Another factor for getting it here. I allowed 2 months for all this tower
to be put up and thought that was enough. Beginning to wonder.

Hope someone can shed some light on this. I have sent email to Cushcraft with
no reply. Anyone who can help I would appreciate it.

3617. Ham III Control Box problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-30 00:00:00 UTC
From: aa651@freenet.toronto.on.ca
Message-ID: <Dwyr5u.BKM.0.queen@torfree.net>
Source record: 194976

Hello all,

I am trying to fix up an old Ham III rotor system. Everything seems to work fine, except that the direction meter will not calibrate properly.

The meter calibration of the extreme full scale (right hand or clockwise south) is supposed to be accomplished by pressing the 'calibrate' button, then turning this knob until clockwise south is indicated.

My problem is that when I press the 'calibrate' button, the meter stays off scale to the far right. I believe that this circuit should be 13V or so, but I measured around 35V.

I was wondering if anyone else out there has had this sort of problem. I think that it is the Zener Diode in the meter transformer circuit.

Regards,

Rick VA3MY

What is with the patronizing attitude?

Someone asked if PLL radios are suitable for 9600 baud.

You authoritatively answered "Yes, my Kenwood works flawlessly".

Several people disagreed with you, and you argued with them, continuing
to claim your radio works flawlessly.

No one, certainly not me, is saying people should start out with the
very best equipment possible - that's your own red herring argument.

If someone is starting out, they're best off if they select the
equipment that works well with a minimum of fuss. This doesn't
mean they have to spend a lot of money - a Tekk radio sells new for
something like $100 and is ideal for 9600 baud, but a fancy
Kenwood sells new for something like $400+ - but it does mean
they should practice some care in the selection of equipment.

There's really no need to become patronizing, Chris.

3622. IC706 Tuner Protocal Semisolved!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-30 00:00:00 UTC
From: wilson@afn.org
Message-ID: <507l9p$i95@huron.eel.ufl.edu>
Source record: 194981

This is a follow up and extension of an eariler post for which I got
few responses.

The Icom 706 tranceiver provides some support for their own automatic
tuners; I'd like use this support for a kind of souped-up "Tennamatic"
interface (73, Jul79 or QST, Oct82) to my Screwdriver antenna.

Although the IC706 instruction and service manuals don't provide any
description of the tranceiver/tuner interface, by reading the schematics
and performing a few careful experiments I have inferred:

The AT180/IC706 interface uses 3 signals:

SEND - Is a wired-or, active-low output from the IC706 that tells the
tuner the tranceiver is transmitting. The AT180 uses this signal
to activate a cooling fan, but it is also forwarded to the tuner
logic.

BDT - (aka BOT, TSTR, STRT and ISTA) is an open-collector I/O line.
There is no pull-up in the tranceiver; a 47K pull-down makes
this line low unless pulled up by a smaller resistor in an
attached tuner. The IC706 samples this line on power-up to infer
the presence of an autotuner. If no tuner is present, the "Tuner"
button is disabled (i.e. it beeps when pressed, but does not
initiate a tuning sequence) and the TKEY signal (described below)
is ignored.

If the IC706 detects a tuner and TKEY is not already asserted, the
IC706 pulses BDT low for about one second. The "Tuner" LED
(inside the "Tuner" button) is illuminated for a similar interval.
If TKEY is asserted, no pulse is generated.

TKEY - If the IC706 detects a tuner on power-up, asserting this active-low
signal places the tranceiver into "tune mode" (i.e. CW, keydown,
~10W output). In tune mode, the "Tuner" LED flashes about once per
second.

The tranceiver leaves "tune mode" and returns to its original mode
when either: 1) TKEY is no longer asserted, 2) the "Tuner" button
is pressed or 3) 20 seconds elapses. In the first instance, the
"Tuner" LED remains lit; in the other cases it is extinguished.

The AH3/IC706 interface omits the SEND signal; the TSTR alias is used
for the BDT signal.

My experiments were performed on 7Mhz with initial mode "12 /A-TUNE STRT"
and "13 PTT TUNE" both set to their default "off" states. Antenna port

SWR has no effect on the experimental outcome.

This probably provides me with enough information to implement my auto-resononator, but I'm still confused about a couple of points. The IC706 instruction manual says you should "Push the [TUNER] button momentarily to toggle the automatic tuner function ON/OFF" and "Push this switch for 2 sec. to manually tune the antenna". (Elsewhere it contradicts itself: "Push and hold [TUNER] for 1 sec to start manual tuning.")

If I were guessing, I would presume pressing [TUNER] would enable the autotuner AND commence an SWR adjustment. If [TUNER] were pressed DURING an SWR minimization, the tuner would be bypassed. If you have an AH3 or AT180, does it really work the way they document it?

Any recommendation would be suspect without the advisor knowing more
about your setup.

1. Does your receiver have a 50 ohm or Hi-Z input?
2. What type of antenna and feedline are you using?
3. Are you adept at building electronics equipment?
4. How much are you willing to spend for a tuner?

The unit is housed in a simple plastic container with little
RF shielding. Your transmitter can cause interference to it,
especially if the wattage is high (the unit was designed for a
4-watt CB) and/or the transmitting antenna is nearby. (as it would
be in a car)

For $30, it makes a fine CW narrow filter or automatic notch
filter. Other than that, try a real DSP unit like the
JPS NIR-12.

Date: 1996-08-30 00:00:00 UTC
From: scederas@intercenter.net
Message-ID: <32262fec.1995167@news.intercenter.net>
Source record: 195001

There is a service bulletin for the TM-732A dated June 28,1993.
Service bulletin code ASB-1027

The title of the service bulletin is: TM-732A Protection of
Q201 in 430 Mhz unit.

Symptom: Q201 the first RF Amplifier in the 430 Mhz unit fails
at random.

Corrective Action: Addition of diode D218 in parallel with diode D214
in the RA line provides increased surge protection for Q201.

Parts required:

QTY: 1 Description: Diode Kenwood Part no.:HSK277

Circuit Description: D218

Time required for this modification is 30 minutes or less. The
modification requires soldering equipment rated for CMOS type
circuits. It also requires familarity with surface mount soldering
techniques. If you do not have the proper equipment or knowledge do
not attempt this modification yourself. Seek qualified assistance.

The previous is directly quoted from the service bulletin I got from
kenwood almost a year ago. The service bulletin is dated June 28,
1993. I hope this helps anyone.

Does anyone know of a mod to allow this rig to operate on 10 KHz steps.
Out of the box in only allows 30 KHz steps and we have 20 KHz
coordination here in TX.

Thanks!
Joe

>: What about the IC 706?

>The IC-706 has the tone burst.

>Clair, K0CJ

No the North American Version of the IC-706 does not have a 1750 Hz burst.
BUT 1750 Hz burst can be added to the IC-706 by using the ICOM HM-77 mic. Just
press the MR button, then press the * for a 0.500 second burst or the # for a
continous 1750 Hz tone.

3649. Re: YAESU FT-50 EXTERNAL SPEAKER/MIC

Paul,
Yaesu sells a _dandy_ adapter plug for the FT50. It plugs into the FT50 spkr/mic plug, and breaks it into two separate sockets for the mic and the speaker. I bought one and plugged my Radio Shack remote speaker mic into it; it works nicely.
I don't know the PTT scheme on those things. Both plugs are tip and sleeve only as I recall.
73,
bernie

3650. Yaesu FT-50R details.....

Source record: 195058

My unit was purchased new from a large retail Ham Outlet-type store.

I was offered the opportunity to "trade up" and get a mod-ed unit right out of the factory box at the time of purchase for $25 more.

As received, Xmit is from 120.3-221.995 MHz (including AM xmit on the air bands) and from 320 MHz to 499.995.

Rx coverage is dead from 222-300 MHz (keypad allows entry, though) but extends from 300-999 MHz. Reception was checked with a Marconi sig gen, and the unit does indeed lock up on a signal every 50 MHz up from 300-999 MHz (some have fairly high sensitivities, .6 and .7 uv around 700 MHz).

I don't know if this is a special overlay loaded into this particular unit or no....I do not have the Yaesu software.

Kind of interested to hear if this is the "normal" expansion or no.

From: viper@visi.net
Message-ID: <505tki$dqt@madrid.visi.net>
Source record: 195059

That's strange, I've not noticed much intermod on mine, & I live in a VERY rf rich area. Pager towers have always plagued ALL my 2meter radios, so I went out & got a 2m intermod filter (around 50-60 dollars) that specifically filters out the 152-154 MHz pager freqs & have had NO intermod on ANY of my radios when used with it! Before, I had intermod EVERY night on ALL my 2m equipment. But my kenwood 733A was no worse , & maybe a little better, than my old alincio dr112 2m rig. David.

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like 'desperate stupid people who will try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new Circuit City Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right away. I can smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!! ....I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious. Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe an tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in position five of the list. This is how the money starts rolling in!

I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so.... But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world-Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the mostdetailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following:
"Please add my name to your list". This creates a service out of this money making system and thus making it completely legal. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service. Make sure you include your name and address. I assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were in slot 3", Just to add a little fun! This is all about having fun

and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. (Preferrably
about 200, if you have the time) The more you post it the more chances you have of someone responding to it. Give a
catchy description of the file so it gets noticed!! Such as:
"NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF
YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever.

Just make sure it represents its true feasibility, NOT something like..."Get one million dollars flooding in your mailbox in two days!"

You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON ITS THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This step added by Charles Reiley). Hello, This is exciting, isn't it?! While I'm on the list, just add a note saying "Please include extra money tips" with your name & E-MAIL address, and I will (FOR FREE) send you some neat methods to increase the money you will receive with this plan. Why?... Why not? I'm not a selfish jerk...I like helping out others. E-mail just makes it a touch easier and cheaper, too! After I drop off the list, I can no longer offer you this advice, obviously, but maybe someone else who gets my tips will offer and simply replace my name on this step number 9. Good luck and give this plan your all, it will definitely pay off! Like Mike said, HAVE FUN WITH IT!!!

3658. Yaesu 2500M and noise burst

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-30 00:00:00 UTC
From: "B. White" <bwhite@execpc.com>
Message-ID: <3226D10D.5A20@execpc.com>
Source record: 195066

HELP!

I own a 2500M radio and it will during a conversation start transmitting a what best can be described as a nosie burst, although this noise burst has been described to me "hiccup" by the others. I can hear the noise busrt will transmitting. The problem does seem to be thermo related but not conclusively as the radio will sometimes transmit the noise after the 2nd keyup and others not during a QSO. The problem seems most prevalent on mid range power setting although I have heard it high power, and I have never heard it on low power. It can be present on mid range and not on high. The radio does have both option modules (PL decode and DMTF) installed. I had installed RFI chokes on the antenna lead, power cable, evev the mic to no avail. I have tried different locations for installing the radio as a base and moblie unit. Again, same problem. The radio has been tried on the mobile antenna (2) and the base same problem, I have remved the option modules same problem.

I took the radio back to the dealer who contacted Yaesu who replaced the radio the another 2500M. This radio exhibits the same problem.

My questions are does antone else own a 2500M that exhibits this problem, and if so have you corrected it?

Of course any suggestions as to fixing this problem will be appreciated. Of corse buying another radio is always an option.

Thanks in advance
KB9LCQ

3660. DSP-232 / TH-79AD Packet problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-30 00:00:00 UTC
From: flywheel@taunet.net.au
Message-ID: <506r56$sqj@pellew.ntu.edu.au>
Source record: 195068
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hi,

I recently bought an AEA DSP-232 TNC/Data controller,
and I'm trying to operate it in 1200 baud packet mode
with a Kenwood TH-79AD HT. I am able to connect with
a local BBS, but there seem to be problems whenever I
the BBS forwards large chunks of data (i.e. several
packets in a row). Everything will be proceeding smoothly,
and then the DSP-232 decides to transmit while the BBS
is still sending data. Then everything stops until the
BBS times out and retries and the DSP-232 acknowledges.

Now here's an interesting symptom: When I unsquelch
the TH-79, the tuning indicator LEDs on the DSP-232
are skewed towards the "Mark" side. Similarly, when
packets are being received, the lights are skewed
towards "Mark". I attributed this to poor frequency
response from the TH-79.

So then I tried a couple of experiments: I connected
the TH-79 to a friend's MFJ TNC. His tuning indicator
seemed to behave as expected (i.e. properly centered),
and the data seemed to flow smoothly. Next, I tried
connecting my friend's 2 meter radio to the DSP-232.
This time, the DSP-232 behaved as expected (properly
centerd tuning). So it seems as though the DSP-232
doesn't "like" the TH-79. I'm at a loss to explain it!

I've tried varying the RF tuning by +/- 5 KHz. This
did not cause any change (nor was this expected, because
it's FM). I've tried tweaking several of the packet
parameters in the DSP-232, including PPERSIST, PERSIST,
MAXFRAME, etc. I've connected various combinations of
resistors and capacitors between the TH-79 output and
DSP-232 input. I've also played with the "WHYNOT" command,
in an attempt to figure out why some of the packets are
failing....

I would appreciate any advice, help, condolences, or
whatever!

Thanks,
Gary VK8GT / KE3WK

I need quantity four of the following items which are no longer of current manufacture. Reasonable price can be paid but substitute items will be of no use.

- TIL 209 red LED. RS Part No 586-475

- LCD clock module. RS Part No 308-499

Parts were current in early/mid-80's. Can any kind soul supply or indicate a known source?

Thanks.

Have you tried Tucker Electronics ??? They have a Web page.

Also, pick up a copy of "Popular Communications" magazine. Many smaller companies advertise in the back and they have better prices.

Source record: 194930

jschelmb@dialnet.net asked:

>Could you be more specific about the cap across the speaker. I also
>have an 8500.

There is a Technical Bulletin on this (# TB-9610) from Yaesu U.S.A. dated 4/22/96.

It suggests putting a 470 uF 16 V (or 220, 330 uF) cap across the speaker leads. Positive lead goes to the red wire of the speaker. You must remove the top cover, disconnect the speaker plug, and solder the leads to the speaker lugs. Bend the leads to clear the large cap on the PWB. The bulletin says to try 470 first, this one made the sound too muffled.

I found the 330 uF (electrolytic - marked 337) worked best.

This is supposed to reduce the high pitched low level continuous tone you may be hearing. I found it particularly annoying if using a remote speaker or headphones.

You can contact Jerry Darby at Yaesu 310-404-2700 about this.

regards,

Jerry Cupples

[...]

The European tone burst is 1750 Hz, which can be achieved by
whistling (don't laugh, it works) or by using a 3.579 MHz
crystal divided by 2048, if you want to be within 2 Hz.

Hope that helps,

As far as I know the Eico was a vacuum tube unit. I know that Heath made a dip meter using a tunnel diode many years ago. As I recall it was not very stable and never gained popularity.

I built an Eico kit in the early 60's. Several years ago I bought a new Millen #90652 SS dip meter. It surpasses the Eico in frequency stability, accuracy, smoothness of dip and overall quality. I don't know if the Millen is still being manufactured. Last known address was Malden, MA 02148.

Must Sell ASAP: (No reasonable offer refused):
(3) Uniden FPS910TS 900 trunked HT. 9 System, 9 group 'brick' radio (rather large, a tiny bit more than the BC1/200 HT). Comes with 2 brand new batteries, 2 older batteries, 3 rapid chargers (not available anymore, hard to come by!!!) and 1 vinyl holster (no belt loop, just more for shipping/travel. $175/ each, Invested much more into it. 2 currently programmed for TAC use.

(1) Johnson 9 channel 40?? (maybe 60) watt mobile. VHF. Was from Florida Sherriff or police which went to 800. Programmable by computer from Johnson Dealer. Must use external speaker (I can dig one out, standard 3.5mm plug), hand mike, and power cord included. GREAT radio. Scans, PL, everything. $250/bo.

(1)Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, Dual watch, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) (PLEASE don't ask how to do it, I was overrun by more questions on how to do it than offers to buy..)Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $280/BO.

All prices plus shipping + COD. I am NOT a company, just a collector of stuff I no longer need. <GRIN>

ALL PRICES NEGOT.! I need to sell, so give me an offer!

eplatt@wco.com, or call me anytime at 415-939-1037.

>Just picked up an FT767GX and looks as though the battery backup is low.
>The manual is of no help. Has anyone replaced the battery and if so
>where is it and what is it?
>
>Thanks. Dale WA2YPY

Dale,

Mine went out after about 1 year. I tried to find it but was unable to locate it quickly. I called my dealer (Amateur Electronic Supply) and they said that there was some problem with the batteries going out earlier than they were supposed to (remember it was one year old then) and they replaced it for free.

I seem to remember that it is a lithium battery of about 3v. It's probably been about 5 years or more since and have had no problem.

You are right - it is not mentioned in the manual.

I know this doesn't help your situation, but thought I would offer what I could.

Regards, Alan, WB2FZC

The 590, 600, and 610 can all be remotely controlled via an HT - if the
PL decoder board is installed. (I don't know about the 605 or 570.)
All of these radios are capable of crossbanding.

>year old radio on 9600 baud packet, I might get reamed too.

Well, Jim, I guess you don't read my posts for the same reason you
don't read Gary Coffman's posts - you might accidently learn something.
However, this doesn't stop you from Drewing, oops, I mean spewing out
comments anyway ;-).

If you'd read my posts, you would have noted that I was explaining
that Greenhalgh's _modern PLL radio_ is not suitable for 9600
baud. Furthermore, if you'd thought about what I wrote, you'd
discover that many older crystal-controlled radios are suitable
for 9600 baud packet. In fact, some of the best and most popular
radios at 9600 baud are Motorola Mitreks, most of which are older
than ten years. Also excellent are Maxars, Maxar 80s and Flexars
(the Flexar I'm currently using for 9600 baud here is from 1980!).

What you apparently did was skip over all the technical content and
home in on Greenhalgh's strawman "not everyone can have the best
radios money can buy" whining. I never said he needed the best
radio money can buy - I simply pointed out that his PLL radio
in unsuitable for a number of technical reasons.

From: "Joe F. BV/N0IAT" <joentam@transend.com.tw>
Message-ID: <508u0h$7i8@keelung.transend.com.tw>
Source record: 195008

Hi,
I've finally found a c-line in near-mint condition and
have seen postings from a few who really seem to love
the Drake equipment.

My question is simple:

What's the best method to use the C-Line in QSK.

I'm a CW-only op (dx / contesting / ragchewing) but have yet
to find something as good as my old Ten Tec OMNI-D with AGC
mods. Hoping the C-line will live up to expectation but need
to find a way to do QSK. Someone mentioned dow-key relays but
went no further.

Appreciate any and all comments. Please emailto: joentam@transend.com.tw

thanks and 73,
Joe

Jim: Next time you order from Texas Towers, ask if they have it in
stock. Why not call HRO or AES and order from stock. Then cancel
your TT order?

73, Jim W9WU

3698. Case paint for Kenwood TS-940

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-31 00:00:00 UTC
From: Dave Skarbowski <skarbows@ptd.net>
Message-ID: <32284CFE.2FC373C2@ptd.net>
Source record: 195018
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Has anyone found a suitable source for the case and
front panel paint on Kenwood HF gear? I have a
relatively late S/N TS940 with scatches on the case
and the outer rim of the front panel and I'd love
to refinish them. The case finish looks like it would
be tough to match as it's a textured (splattered?)
finish. The front panel rim is just a plain semi-gloss.
Anybody tackle this sort of thing? Could a local
auto-body shop duplicate these finishes? All suggestions
welcomed.

Dave, n2fam

I recently bought a "Tele-Connect 850" at a hamfest for $10. Its quite old, but it looked like it was worth playig with...so I bought it. Has anyone heard of this Phone Patch? If you have, could you tell me what you think of it? Is it worth trying to fix?

I have also heard that the process that is used to decode DTMF's is an important factor as to how reliable it will be. I was wondering if anyone knows what process is being used here. Is it reliable one? When I say reliable, I mean I don't want to see it turning on half the time when someone is talking, and I don't want to push the DTMF 5 times to get it to activate.

3707. Need VOX for KWood TS-50/60?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-01 00:00:00 UTC
From: Larry Minnis <wb6vgi@erols.com>
Message-ID: <322A342D.6692@erols.com>
Source record: 194877
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have a Kenwood TS-50 that I haul down to Gitmo, Cuba all the time. I love the rig but have been trying to figure out how to come up with VOX for it. I have a Heil boom set that I use so I can type on the laptop as I talk. The footswitch works, but "walks" around the floor. Well, I've finally found the solution. The ICOM EX-1514 external VOX unit! After getting the schematic from ICOM, a bit research revealed that only minor modifications would be required. This modification requires a rewire of the mike plug on the front of the unit. After carefully checking the pinouts vs wire color, I rewired the mike jack on the unit for a Kenwood radio. Rather than changing attached mike plug and playing with the mike jack on the EX-1514, its easier to just pull all the wires off of the mike jack. I then rewired the jack to look like a Kenwood mike jack. I attached the wires from the vox unit to the mike wires with some small shrink tubing before soldering back to the jack. This keeps you from having to fight with two wires on the same pin on the back of the jack. The VOX unit pulls the required power off of the TS-50/60 mike pin along with the audio needed for the anti-vox circuit. Works great and only minor amount of work with a soldering iron. I'll be testing it out on my next trip to KG4 land starting on the 10th of September. Hope to work you from there. Larry, WB6VGI/KG4ML.

From: docjim@getnet.com (Jim Gyer)
Subject: Re: HELP: IS PC SWITCHING POWER SUPPLY OK???
Organization: Just my little old self

No problem with switchers per se, but pirateing a computer supply is
not without its problems.

All switchers require a minimum load. In many computer supplies its
the fan. Some assume some minimum load on the mother board. They go
out of regulation or stop oscillating and smoke with less than the
minimum current draw.

My ICOM IC740 has the optional built-in 13.8 volt supply and it works
fine but it was designed for communications.

There is a big difference between 12 volts and 13.8 volts. In the
case of my Radio Shack HTX-202 2 meter handy-talky it's 6 Watts at
13.8 and 5 W at 12.0. That's a 20% drop in power. Most mobile
equipment assumes a vehicle with a running alternator which is where
the 13.8 value comes from.

The resistance wire mentioned above works well, but be aware you can't solder
to it. You'll have to clamp it with a nut and bolt or something similar.
Personally, I'd send Astron the buck plus whatever.

>
> What's the best method to use the C-Line in QSK.

I don't exactly run full break in with the C-Line, but you
might want to try what I do. I have a "semi-mute" cable which consists
of a 100k pot across the mute line cable, you adjust it while
transmitting so that you can hear your transmitter without overloading
the receiver, when you aren't transmitting the mute line signal is
shorted by the transmitter and receive is normal. If you set the vox
delay short enough, it is almost like full break in, and I like
hearing my transmitter as the sidetone (I turned the normal sidetone
off).

You might want to give this a try since it is simple, cheap, and makes
the C-Line very enjoyable for me.

Regards,

Message-ID: <50atmv$37ls@news.doit.wisc.edu>
Source record: 194944

Hi all,

The backlighting lamps in my Yaesu FT-2200 (3 years old) just "died" and I am looking for replacements and tips on replacing these lamps. Since this just happened (on a Saturday), I have not had the chance to check with Yaesu or AES and see if they can help in getting replacement lamps.

It would seem a shame to send the Yaesu in for service for such a minor problem, but the rig using suface mount technology (or at least very small components), and my eyes are not what they used to be, any tips that people could provide me in getting and replacing these lamps would be greatly appreciated.

Please respond directly to : bmicales@facstaff.wisc.edu

Many , many thanks in advance.

3716. TM-732A Service Bulletin

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-01 00:00:00 UTC
From: scederas@intercenter.net
Message-ID: <32292561.694876@news.intercenter.net>
Source record: 194947

There is a service bulletin for the TM-732A dated June 28,1993.
Service bulletin code ASB-1027

The title of the service bulletin is: TM-732A Protection of
Q201 in 430 Mhz unit.

Symptom: Q201 the first RF Amplifier in the 430 Mhz unit fails
at random.

Corrective Action: Addition of diode D218 in parallel with diode D214
in the RA line provides increased surge

protection for Q201.

Parts required:

QTY: 1 Description: Diode Kenwood Part no.:HSK277

Circuit Description: D218

Time required for this modification is 30 minutes or less. The
modification requires soldering equipment rated for CMOS type
circuits. It also requires familarity with surface mount soldering
techniques. If you do not have the proper equipment or knowledge do
not attempt this modification yourself. Seek qualified assistance.

The previous is directly quoted from the service bulletin I got from
kenwood almost a year ago. The service bulletin is dated June 28,
1993. I hope this helps anyone.

The new "reformulated" gas that we are stuck with now in California SHOULD NOT be stored more than a week or so in your generator. Unfortunately the new fuel is VERY DAMAGING to rubber parts in the fuel system, especially in the carb. Before reformulation, we could reasonably store the gas, but since the reformulation if you do it you'll be rebuilding your carb much sooner than need be. Its a hassle running the fuel system dry, but when you need the generator the next time, you'll want it to work!

73,
Brad

PS - Hopefully other states don't have this new "reformulated fuel".

3718. Need Schematic for Knight KG696 Signal Generator

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-01 00:00:00 UTC
From: "miker in Tigard, OR." <mreiney@hevanet.com>
Message-ID: <32296C15.2B22@hevanet.com>

I need the schematic for the Knight KG606 Signal Generator.
It's an early solid-state unit with the big vernier dial that takes
up most of the front panel.
Got it used. Works great on the lower three ranges, but output is
way down on top two. Like 1%. It's not frequency dependent; it's
range dependent. I'm wondering if it's assembled
correctly.
Thanks, miker

Hi

Inside my IC2000H there's a big looped diode (D25) sticking straight up.
It looks like it's just begging to be cut to unlock something....but WHAT?

500 more memory channels?
Receive from 0-1.3 Ghz?
The 440 band? (Don't I WISH!)
Nothing?

Please respond E-Mail. This newsgroup is WAY too large to download and
pick through every day.

Thanks

I'd suggest ignorance is recomending using an unsuitable $500 radio
to do the job of a $100 data radio. It's cheaper to do it right than
it is to do it wrong, and you'll cause less harm to other users of
the LAN in the process.

3730. Poor review of ICOM iC-2350H

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-01 00:00:00 UTC
From: Bill Stewart <stewart@peganet.com>
Message-ID: <3229BC2C.7EFA@peganet.com>
Source record: 194961

The much bally-hooed ICOM IC-2350H dual band rig has a major bug that ICOM refuses to admit.

The radio fails to mute to subband while transmitting on the selected band. You thus end up re-transmitting whoever is talking on the other band through your mic without their knowledge.

Granted, the ability to receive while transmitting is necessary if the rig is going to be used as a cross-band repeater. However, that function is NOT DOCUMENTED BY ICOM and could easily have been enabled when cross-band repeat is enabled, certainly a rare event.

ICOM's super sophisticated, high tech solution ? Turn down the volume on the subband when transmitting, and then remember to turn it back up when done so you can hear the other band again.

My recommendation as an owner of the rig ? If you can live with having to make manual adjustments to the radio whenever you choose to transmit on one band or the other, it's a fine rig. But this lack of such a basic function as muting receive during transmit gives it my "Unacceptable" rating.

Power in your house is single phase.
The pole transformer outside the house has one seconardary
winding of 240vac that is center tapped.
Three phase power in a home is a "special".
Most 240VAC(or 230vac whatever) will operate from 208VAC
three phase - most.

>whatever!

Well, it's a Kenwood, what'd you expect. :-)

I think you're on the right track thinking you have an
audio equalization problem. You say it works Ok with
the MFJ and I know that unit has a 10 kohm input impedance.
What's the input impedance of the AEA? It should be high
enough to "bridge" on the output of the Kenmore. You could
try using a 45 ohm "dummy" load on the Kelvinator and
bridge across that with the TNC. The lack of proper load
may be messing up the output amp response in the Kenworth.

Perhaps there's a wee bit of DC on the Kemtone's audio
output. That could be biasing the AEA out of spec if its
input isn't capacitively coupled. The MFJ uses capacitor
coupling for its input audio. Try putting a 0.1 uF in
series with the audio line.

One final thing to check. Look at your common connection
to the radio. You should use either speaker low or mic
low, not both. One may not *really* be common, so try
each one in turn.

All you need for Digital Amateur communications.

Does RTTY, CW, FAX, SSTV up to 16 million colors

Monitor packit without the cost of a modem.

Join the 14.230 and 14.233 SSTV Nets.
2 meter SSTV getting hotter every day, don't be left out.

Copy CW up to 40 wpm.(catch all the ARRL buletins)

look in on Ship to shore SYNOP, NAVTEX, etc.

Get weather faxes with your two meter rig.

(((All for $17.00 +SH!)))

Over 100 in stock.

Send a check and you will be on the air in less than a week.
I ship the same day, I receive your check.

Take a look at http://www.cris.com/~n9zle/hc.html
mailto:n9zle@concentric.net
I will also be at the Louisville Hamfest Sept 7-8

3745. Texas Scar and Palomar CB Amps

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-02 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <50frij$7pb@newsbf02.news.aol.com>
Source record: 194826

I tested a Deerhunter 100 amp someone sent to me. IMD is standard method of -dB from one tone of a two tone test on 14 MHz:

First the results of an !C 706A I modified to reduce IMD level. Power is PEP:

10 watts 3rd -22, 5th -32, 7th -38
50 watts 3rd -27, 5th -34, 7th -40
100 watts 3rd -30, 5th -32, 7th -41

That illustrates one of my worries about driving a tetrode with ten watts from a 100 watt exciter. Low order (and some higher order) IMD products actually get worse at low power.

Next the Deerhunter, reputed to be a "clean" amp.

10w 3rd -8, 5th -14, 7th -22
25w 3rd -10, 5th -15, 7th -23
50w 3rd -12, 5th -17, 7th -22

staturation power 60 watts in a two tone test

60w 3rd -13, 5th -20, 7th -23

Harmonics at 50 watts single tone
2nd 3 rd 4th 5th 10th
2 MHz -4 -4 -4 -10 -16
14 MHz -3 -10 -17 -32 -43
28 MHz -28 -38 -39 -37 -52

Won't it be nice if people start using CB amps on the Ham bands?

Hw about two 1/4 ground planes fed with one coax and mounted on inside of
car nex to rear glass. Use #30 magnet wire for the verticals. It is
"real" stealth. I do this one my car fora about 5 years. Works great and
nobody knows it is there!

O there is indeed another inexpensive 6 mtr. rig...

The MFJ 9060 is out and they had such a run on the first production run, they are now scrambling to get the second batch out the door...

Looks like the 9020 small...ten watts out comes with a microphone and the CW adapter is extra...but for $250 you can get a rig with analog tuning a S-meter and volume contraol on the front...a mic ALC on the back that adjust the output power with a hot receiver and reports of great audio all the time..

I know, I own one and have had several friends get them and we are having a ball on 6 SSB...

From: markem@primenet.com
Message-ID: <50g9ak$g9c@nnrp1.news.primenet.com>
Source record: 194832

I missed the first part of this thread, so forgive me if it's already been discussed. I've recently become interested in solid state replacements for rectifier tubes, particularly the 5U4 and the 5R4 (yep, it's a Collins 516F-2). Seems I remember solid state replacements being available for these (at least the 5U4) but I haven't been able to locate any (haven't tried REAL hard, tho). Anybody know if & where I might find some?

The obvious would be to substitute a couple of diodes (1N400x) for the the diodes in the tubes, wiring the anodes & cathodes correctly, of course, and disconnecting the filament supplies. Seems to me I remember something about differences in voltage drops between the tubes and the solid state diodes, tho, and that there has to be a resistor in the circuit (in series with the diodes?) to compensate for that. Other than that it seems like a simple thing to do...could even build them in an octal plug and not make any permanent mods to the gear. Sure would cut down the heat from the supply. Seems like a real waste to spend all that power lighting rectifier filaments. Probably be cheaper than new tubes, too.

Any comments? Any pointers to designs like this?

Thanks & 73... Mark AA7TA

I am the happy owner of an Icom IC-2GXAT HT. I am also a member of my =
town's fire department. Since my FD's frequency is in the 169 MHz range, =
I had my HT modified so that I could use it while driving to the scene.
At that point, everything woud be fine if it wasn't for the fact that my =
brigade had DPL (Digital Private Line) instaled in our radios a while =
back. Way before I got my rig, for that matter. Anyway, the only radio =
that can effectively hear me is in our pumper because I pushed the =
monitor button so it is listening on everything on that frequency.
I was told by a friend of mine that a DPL daughterboard could be =
installed in my rig so that I could be heard by everybody in my brigade. =
This is great but I was also told that since it cannot be programmed to =
work on certain frequencies only, it would be constantly in use every =
time I'd push the PTT button.
Now, my concern is that in doing so, I might get in trouble while using =
the repeaters in my area. Could I get blocked off those repeaters ? =
Would it interfere with my tone squelch programming on certain =
frequencies ?
I presume that this daughterboard is supplied by my rig's battery. Would =
it be possible to wire a small, I mean real small on/off switch so that =
I can turn it off when I'm using it on the 2m band ?
I guess that's all for now. If I get anything esle on my mind, I'll pass =
it along.

3754. Re: Yaesu FT-50R (Ham) / Vertex VX-10 (Business)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-02 00:00:00 UTC
From: "J.R. Marshall" <jr@apu.edu>
Message-ID: <322BC2CE.7495@apu.edu>
Source record: 194835

Well, the difference is in the target market and the features. The Yaesu FT-50R (http://www.yaesu.com/ft50.html) is a dual bander with wide RX, built for Hams, while the Vertex VX-10 (http://www.yaesu.com/vertex/vx10.html)is a Commercial Rig.

The different band splits offered with the VX-10 are: 134-144, 150-163, 161-174MHz, 410-430, 450-485, and 485-512MHz. Advanced Digital's (http://www.advdig.com/vertexport.html) price is $435. It has Tone and Digital Private Line, and voice encryption.

The stock FT-50R has TX of 144-148 and 430-450MHz, and RX of 76-200, 300-400, 400-540, and 590-999MHz (minus cellular). It can reportedly (http://members.gnn.com/hca/ft50/index.htm) be modified to TX 120-221 and 320-499. It includes Tone and Digital PL, and with an optional keypad (FTT-12, $65) it can record & playback twenty seconds of audio, and decode TPL and DPL. Ham Radio Outlet's (www.hamradio.com) price is $340.

The accessories are similar to identical between the radios. The Battery cable extender (PA-17, $65) is cool, though questionably useful. The desktop dual charger (NC-50 & CA-14, $114) is pricey, but nice. I have not found any practical use for the RH-1 Rubber Holster, ($8) though it is the least expensive part of my rig. The ADMS-1C software ($40) is very slick, allowing easy channel manipulation and archiving. The speaker mic (MH-34B4B, $30) appears ok, and The leatherette case CSC-68 ($14) is handy.

If your application is to use a Ham radio, I would Pick the FT-50R. If you are looking to set up a business band radio system, you could consider the VX-10.
-J.R.

3756. Tempo One and the 10 Meter Band

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-02 00:00:00 UTC
From: Steemer <stanl@primenet.com>
Message-ID: <50ghu9$uf@nnrp1.news.primenet.com>
Source record: 194837

I recently bought an old Tempo One at a hamfest. After playing with it for a while and talking to a couple of people, I found out that the reason most of the ten meter band doesn't work is because when they made these things at the factory, to save money, they only put in one crystal for one of the sections(out of the four) for the 10 meter band.

I looked inside and found what they said was true. There is a board that has four places for crystals and there is only one crystal installed.

I need to know where I can find the proper crystals to fully install the 10 meter band(for the remaining three sections that are empty).

I know ten meters is dead right now, but I thought it would still be nice to have it for future use.

Does anyone know where I can find the proper crystals? How much do they cost? Aren't there certain specs on crystals that have to be met in order for them to work properly in a specific radio? If so, I would need to know these specs before ordering....

Any help anyone may have would be greatly appreciated.

Thanks.

Stanl

I had a *crystal* radio built from a kit when I was a kid. It too was a boy scout project. The detector was a metal cup about 1/2" deep and also 1/2" diameter. The cup was filled with solder and in the middle of the solder, with a surface sticking above, was a galina (spelling) crystal. It worked great.

Some thoughts. Mine and the razor blade version differ in the detector used. It was much like the razor blade version. Steel is iron with some carbon in it and there are spots where the alloying is not perfect and some carbon crystals exist. This is what you're hunting for when you probe around to find a *sweet spot*. The wire probe is the *cats whisker*. I'm guessing my whisker was phosphore/bronze from its color and springyness. Since it's the other half of the diode, experiment with different materials.

Mine had some added features that will improve the radio described below by Craig (AA0ZZ). If you have more than one strong station you may get them all together. An LC tuning between the antenna and the detector will give a good deal of selectivity. Mine had a coil reminisent of a toilet paper tube wrapped with 3 or 4 inches of maybe #30 enameled wire. A fixed capacitor was in parallel with the coil and a sliding wiper shorted out part of the coil to produce a variable LC. One end of the tuned circuit went to ground the other to the antenna. The antenna also went to the detector. The other side of the detector went to the headphones which returned to ground. Got good volume and good selectivity with a 50 foot overhead wire at my home about 30 miles from the Philadelphia radio stations. It was great fun.

My father told me before tube radios became affordable a good crystal set with the earphone carefully placed in a crystal glass bowl (a punch bowl) gave something loud enough for family entertainment. The crystal glass resonated - don't know if a modern plastic one would work. The other trick was to put the earphone at the small end of the *morning glory* horn found on old acoustic record players. This easily gave room volume.

Good luck

No problem with switchers per se, but pirateing a computer supply is
not without its problems.

All switchers require a minimum load. In many computer supplies its
the fan. Some assume some minimum load on the mother board. They go
out of regulation or stop oscillating and smoke with less than the
minimum current draw.

My ICOM IC740 has the optional built-in 13.8 volt supply and it works
fine but it was designed for communications.

There is a big difference between 12 volts and 13.8 volts. In the
case of my Radio Shack HTX-202 2 meter handy-talky it's 6 Watts at
13.8 and 5 W at 12.0. That's a 20% drop in power. Most mobile
equipment assumes a vehicle with a running alternator which is where
the 13.8 value comes from.

3760. Lamp Replacement on Yaesu FT-227R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-02 00:00:00 UTC
From: "Bruce.Micales%1": 2619/211.9;
Message-ID: <fff_9609062047@woodybbs.com>

To: Bruce Micales%1:2619/211.9%12:320/100.666
From: bmicales@facstaff.wisc.edu (Bruce Micales)
Subject: Lamp Replacement on Yaesu FT-227R
Organization: UW-Madison

Hi all,

I have an old Yaesu FT-227R Memorizer and the lamps for the
"Memory" and "Memory Recall" have recently burnt out. I opened
the rig in hopes to quickly replace these lamps, but it appears that
these lamps are held in place with wax (or some sort of material).

Does anyone have any ideas on the best way to remove and then
replace these lamps? Are they in fact held in place with some sort
of wax or rubber cement?

Your suggestions will be greatly appreciated.

From: jean-pierre magnan <fireman@netrover.com>
Subject: Is this possible ?
Organization: Service des incendies de Notre-Dame-du-Mont-Carmel

I am the happy owner of an Icom IC-2GXAT HT. I am also a member of my =

town's fire department. Since my FD's frequency is in the 169 MHz range, =

I had my HT modified so that I could use it while driving to the scene.

At that point, everything woud be fine if it wasn't for the fact that my =

brigade had DPL (Digital Private Line) instaled in our radios a while =

back. Way before I got my rig, for that matter. Anyway, the only radio =

that can effectively hear me is in our pumper because I pushed the =

monitor button so it is listening on everything on that frequency.

I was told by a friend of mine that a DPL daughterboard could be =

installed in my rig so that I could be heard by everybody in my brigade. =

This is great but I was also told that since it cannot be programmed to =

work on certain frequencies only, it would be constantly in use every =

time I'd push the PTT button.

Now, my concern is that in doing so, I might get in trouble while using =

the repeaters in my area. Could I get blocked off those repeaters ? =

Would it interfere with my tone squelch programming on certain =

frequencies ?

I presume that this daughterboard is supplied by my rig's battery. Would =

it be possible to wire a small, I mean real small on/off switch so that =

I can turn it off when I'm using it on the 2m band ?

I guess that's all for now. If I get anything esle on my mind, I'll pass =

it along.

-- =

If you can't stay dry, at least stay safe !

Subject: 6 mtr. radio
Organization: INTERNET AMERICA

O there is indeed another inexpensive 6 mtr. rig...

The MFJ 9060 is out and they had such a run on the first production run, they are now scrambling to get the second batch out the door...

Looks like the 9020 small...ten watts out comes with a microphone and the CW adapter is extra...but for $250 you can get a rig with analog tuning a S-meter and volume contraol on the front...a mic ALC on the back that adjust the output power with a hot receiver and reports of great audio all the time..

I know, I own one and have had several friends get them and we are having a ball on 6 SSB...

Hello,

Have anyone information about programming the Kenwood TH-79E with your computer ? . I can't find any information how do do this.

I know it is possible because there is a programma called "EZCLONE" whichs can programs your portable rig.

1) What kind of hardware is required ?
2) Where can I found information how to programs my portable rig. I couldn't found anything in the manual or the Website of Kenwood.

Several ideas come to mind:
IF you are limited to 300 watts the TITAN is TOO MUCH amp.
The Titan is setup for 220VAC feed. It runs two 3cx800's
and covers 160 through 10 meters. The plate meter goes to
1.5 amperes and it runs about 2100 volts to the plates.
DO NOT OVER DRIVE THE GRIDS, they go away if you do!
It weighs too much to carry on a contest - expedition.
Two parts : power supply & RF deck. Typical used price
is $2000 US. GL. It will burn a hole in the ozone!

You can save about $20 rebuilding the pack yourself. I'm not sure
its worth it. I've done it in the past, but I've got better uses
for my time than busting into glued plastic cases. (If you want
to do it, here's a tip. Put the pack in the freezer for a couple
of hours, then rap it hard against a table edge. The glue will
break before the plastic, so the case halves will separate.)

>
>My name is Ryan, KE4GEN, and I just upgraded to Tech Plus. Seeing that I
>have HF privledges, I would like some recommendations for good radios which
>I can also use when I get my General. Tnx in advance,

That depends on how much you want to spend, whether you'll accept
used equipment or must have new, how you're going to use the radio,
etc. If money is no object, then buy the top of the line Yaesu or
Icom or TenTec. (Some would also include Kenwood, but service problems
with that brand lead me to suggest you avoid it for now.)

If money is a concern but you still want new equipment, drop down
to the lower priced Yaesu equipment. If you need an itty bitty
radio (say you want to operate mobile), then look at the IC706 and
Alinco DX70T. Realize there are some performance compromises inherent
in going that small.

If you're willing to buy used equipment, you'll have a number of
other options. There is some really nice tube type equipment still
around on the used market, but most of it is really long in the
tooth and repair parts are getting harder to find. A set of Drake
Twins or a Collins rig might serve you well, but you probably should
consider them restoration projects. Hybrids like the TS-520, TS-830,
and the myriad versions of the FT-101 are another option. Again, think
about getting repair parts and consumables (like tubes) before you buy.
As with early all solid state radios, receiver performance in these
hybrids isn't up to today's standards.

All solid state rigs fall into two camps. The early ones often had
worse performance than tube rigs, especially in regard to poor strong
signal handling on receive. The newer ones are often clearly superior.
There are so many models in this class that it is hard to make clear
recomendations. However, one radio does stand out as clearly the class
of the class. That's the IC-735. Very rarely, all the factors which make
a radio great come together in just the right mix. That describes the
IC-735. While perhaps not the best radio in any one particular feature,
the combination is more than the sum of the parts. This radio had the
longest production run of any amateur radio in history, and it remained
basically unchanged throughout all that time. They got it right the first
time.

Some other Icom models aren't as desirable, for example the IC-745
had horrible overload problems, and some Icom radios had their
personalities coded in battery backed RAM. As the lithium batteries

die, the radio stops working and requires a trip back to Icom for reprogramming. You don't really want one of these, otherwise desirable as they may be. (There is a third party fix for some of these radios which replaces the battery backed RAM with a ROM. If the radio you are considering has had this done, it is more desirable.)

Kenwood quality has been so spotty in recent years that one can't say too much in general about them. Some work well, some hardly work at all, and Kenwood service has a very bad reputation. Yaesu radios have improved dramatically in recent years, but earlier ones have a spotty record. Some are OK, some are real stinkers. A lot of Yaesu radios have been converted for outlaw CB use, and these could really be butchered, beware.

TenTec has by far the best reputation for factory service and support. The only problem with that is that you may need it. The radios are often plagued with intermittant connection problems. These can be infuriating to find, but are generally easy to fix. To me, early TenTec radios look and feel cheesy, but they can work very well.

Remember that when buying used a lot depends on the particular history of the particular radio. General brand and model recomendations are only that, a general guide. Examine any particular radio you are considering purchasing very carefully before throwing down the green and carting it home. Cosmetics aren't a reliable guide. A very pretty radio can work really poorly, and a scruffy radio may work fine. If possible, try before you buy.

3786. Re: Lafayette grid dip meter info needed.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-02 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1996Sep2.143317.26132@ke4zv.atl.ga.us>
Source record: 194899

In article <4v9oe6$7t0@panix.com> ekv@panix.com (Elmar Vaher) writes:
>Greetings
>I bought a Lafayette grid dip meter at a hamfest yesterday and need a copy
>of the instruction book and schematic. Will reimburse for any expenses.

I can't help with a manual, but these things all use pretty much the
same circuit. Look in an old Handbook.

>This meter comes with color coded coils and has a phone jack on the side for
>audio. Its an AC unit and I pan to try to convert it to a battery and unit.
>I don't have the model number on hand right now.

The color codes should match the frequency scales on the instrument.
If they don't, they go up in frequency as the number of turns on
the coil decrease, so you should be able to figure it out.

>I would also like to learn exactly how to use it and what are the many
>ways it can be used. I would like to start by measuring some coil
>inductances and antenna resonant frequencys. Not sure of how to proceed.

A book could be written on the uses of the GDO. Here's a way to use
one to measure coil inductance. First find a known value capacitor,
mica preferred, which should, by eyeball guess, resonate the coil
at a convienent frequency. Hook the capacitor in parallel with the
coil. Select the proper GDO coil for this frequency range. Now
approach the coil with the GDO coil and tune around looking for a
dip on the meter. The tighter you couple to the coil, IE the closer
you get, the broader but deeper the dip. The more lightly you
couple, the sharper the dip. Try to get the sharpest dip possible
which you can still reliably see on the meter (there's probably
a sensitivity pot for the meter, you may have to readjust this
as you go). This is the resonant frequency of the LC combination.
The frequency scale on the instrument is crude, so use a receiver
or frequency counter to get the exact resonant frequency (note
changing the coupling of the GDO coil will pull the frequency,
so measure it in place). Now use the chart in the Handbook, or
the LC resonance formula, to find the inductance of the coil.

There's a certain amount of "feel" involved in using a GDO, so
practice until you become familiar with how much coupling you need,
how sharp the dip is expected to be, etc. At higher frequencies,
be careful of strays. If you use clip leads to attach the capacitor
to the coil, they may change the resonance due to strays. Try to
keep leads very short.

For antenna work, put a couple of turns across the antenna feedpoint,
or across the end of the feedline, and probe it with the GDO looking
for a resonance dip. Note that there will be several across the
spectrum because antennas show harmonically related resonances.
Note too that the feedline can show resonances, so if you measure
with the feedline in place you have to be careful or you'll be
measuring the wrong thing.

>I'd suggest ignorance is recomending using an unsuitable $500 radio
>to do the job of a $100 data radio.

Gary, as you very well know, the problem isn't just ignorance.
It is not helpful to criticize someone for not knowing something.

The man bought the wrong radio, probably after spending a number of
hours agonizing over the expense, and asking around and getting opinions
from his buddies. Now he feels honor-bound to defend his choice.

What's sad here is that neither he nor his buddies knew the correct
answer - but there is no shame to him in not knowing. What's wrong
is that there are still people who don't know that the so-called
'9600 baud ready' radios generally aren't.

The shame is on the manufacturers who are duping people into buying
equipment which is unsuitable (or actively harmful) to the mode.

I would challenge TAPR, the ARRL, and any of the large packet clubs
to make it a point of honor to publish articles explaining WHY those
radios aren't suitable, and perhaps even to provide test data of
each of the various offerings.

I have not read any equipment reviews of any of the '9600 ready' radios
in QST or elsewhere. Have any of those reviews mentioned T/R delays
or PLL sweeping? Do the test labs even check those items?

Dana,

Don't take Chris too seriously he doesn't take to education too well.

Trying to educate Chris is kind of like trying to teach a pig to sing
it can't be done and it just annoys the pig. You and Gary and others
have experience and knowledge to offer don't waste your time on those
who will not hear.

I did find it interesting that a computer tech (from Chris's sig line)
does not understand collisions and service times better than he seems
to. I learned these lessons on a MicroVax I when I tried to lengthen
the disk drive data cable. The strobe reflections would take the entire
machine down.

We tend to use old Motorola rock bound radios for our 9600 baud stuff
as they are very stable and you can drop a truck on them. The test
points at the discriminator and varactor just make it even easier.
They use a lot more power than the TEKKs but I like the stability.

Now I must retire and put on my flame suit for the "Liar, liar, pants
on fire" tirade that is sure to follow this post.

Be very careful using the SMA-BNC adaptor. It has no shoulder, as the
stock antenna does, to spread mechanical stresses. If you aren't careful,
you can break the SMA out of the radio's case by tugging on the coax.
Also realize that SMA connectors (and BNC connectors for that matter)
are intended to be *assembly* connectors. They are not designed for
frequent connection and disconnection. They will wear quickly and become
intermittant. If you use the adaptor, connect and disconnect the BNC
end only. When it wears out, you can easily replace it. Replacing the
SMA in the radio is a much tougher job.

> to have a Utica 650 and a Swan 250.

A few years ago, you used a transverter or the (expensive) IC551
to operate on 6m (or a boatanchor like the Swan) if you wanted to
do SSB. Today a lot of us are using the IC706 on 6m. For a while,
there was a dearth of good SSB equipment for 6m, but that has changed
now. There's lots of commercial gear available, and most of it is HF
too, IE 160m-6m is becoming standard on HF rigs. TenTec does have a
transverter kit from 20m->6m, though, for about $100. If you already
have a HF rig, this is a good way to go. MFJ makes a little 6m rig
too.

This does mean that there isn't yet a lot of good late model used
equipment available for this band. Either you find something very
old or very new available.

There's some FM only equipment available now too, but converted
low band commercial surplus is still the cost effective way to
go for that.

>buy the longer one if you work alot of fringe areas, otherwise go for
>the short one.

Note, a very flat SWR curve across the band is NOT A GOOD THING.
It usually means there is something wrong. Often it means that
Rrad is being swamped by Rloss, IE antenna efficiency really sucks.
Sometimes it can mean the feedline loss is very high. Sometimes
it indicates a problem in the base matching network. But it is
never *normal*.

An antenna quickly becomes reactive either side of resonance,
and that should result in a U shaped SWR curve centered on the
frequency on which the antenna is resonant. If you don't see
this U shaped curve, PANIC, there's something wrong somewhere
in the antenna or feed system. It may still appear to "work"
but even a wet string can "work". It won't be working *well*.
Only a dummy load should have a flat SWR.

Caveat: very fat radiators can have a broad SWR curve, example
is a discone, but for normal thin radiators, this is not the
case. There are other odd exceptions, but the MFJ antenna doesn't
fit any of them.

>levels are whats needed for high DR operation in single ended amps like
>those in the Drake.

Remember that almost all of the heat in a small receiving tube is the
result of the *filament* current. Since the tubesters don't have
filaments, it is natural that they would run much cooler. These
devices have a large value dropping resistor in the collector
circuit as I recall, so the voltage drop across the device itself
is small, and power dissipation in the device proportionately small.
Still, as I recall, standing current in the devices is fairly low,
but realize it was small in the tube too compared to what we might
use in a modern receiver, IE small receiving tube plate currents
were in the range of 4-15 mA. Reported IMD performance with tubesters
wasn't good, but that also had a good deal to do with the devices
available at the time and with their use in circuits not designed
for solid state devices.

If you were to design a more modern tubester, using GASFETS or
HEXFETS for example, you might find that they'd work pretty well.

QST has started reporting BER measurements on radios claiming
"9600 baud ready". They first did that in an article explaining
their test procedures. Most recently they published results for
the shootout among dualbanders. The results have been almost
uniformly grim.

They don't appear to be specifically testing T/R delay or PLL
sweeping. That is a flaw in their testing paradigm. But since
BER is so uniformly grim, T/R switching time is a moot point.
PLL sweeping is a more universal flaw, affecting more than
packet performance. I would expect they would highlight such
a defect as a matter of course in their routine testing of
radios. But I don't recall seeing any mention of it in tests
of radios which I know do have the problem. Perhaps this is
something that should be drawn to the attention of the ARRL
lab.

> the bias adjusted properly.

Flood damage can be nasty. Any paper electrolytic capacitors may be ruined, and slug tuned coils can be grossly detuned. Little trimmer capacitors can be gummed up too. Spray the coils and trimmers with an aerosol cleaner *non-lubricated* type, may be called contact cleaner, get all the switches too. Pots are suspect as well. Clean all the pots as a first step, use a proper lubricated aerosol cleaner such as Quietrol. Don't mess with the coil tuning, and put all the trimmers and pots back where you found them after cleaning. You don't want to be doing an alignment if you don't have to.

The 30 volts may also be a symptom of a shorted component deeper in the radio. Try removing the 35 volt lead from each board that uses it, one at a time, and see if the voltage comes back up. If disconnecting a particular board lets the voltage come back to normal, then look for a shorted component on that board dragging it down.

Any hum? That would be a clear indication of a failed filter capacitor. I think your statement below about the dead BFO explains why the product detector isn't working.

> Measured voltages on IF board and discovered the
> following. Q504 2nd IF AMP-collector voltage too

> Q503 IF AMP no emitter voltage either mode,
> collector too high in STBY mode.

I can't offer too much here without seeing the circuit, but Q503 may be bad, or the circuitry which biases it may be bad.

> Mixer board the emitter on Q202 is 5 volts too
> high.

Probably the HFO isn't working.

> PS BFO board no voltages at all on Q601 and Q602.

Very bad. Concentrate on fixing this right away. You need the BFO working to get the product detector working. Often there is a separate regulator associated with the oscillator circuits. Look around and see if you can find that. It's probably gone south.

> On the RF Amp. board Gate2 on the single device is

The AGC *is* a feedback loop. I wouldn't worry too much about
this right now. Lets concentrate on getting some oscillators
oscillating first. Have you got another *working* SW receiver?
If so, tune to the various oscillator frequencies in the radio
and confirm if any of them are working or not.

If yours won't start after you've been yakking with the amp for a
while, it may be one of the ones. But much more likely is that you've
just killed the battery. That amp draws *lots* of current.

I don't want to discourage you from installing the amp, but a
portable beam antenna will probably be more useful from your
camping spot than that battery eating amp. And for sure if you
get the RF away from the car, it won't kill the computer.

>1.1//// help

Well obviously the amplifier isn't presenting a very good match
to the radio. That's what the radio is seeing as a load, the
input to the amplifier. The antenna has nothing to do with it.
Since you say the antenna has a good SWR without the tuner,
why don't you put the tuner between the radio and the amplifier
so you can match the radio to the amplifier input and avoid this
high SWR business?

I don't recomend it though. The LO tends to have a spectrum like
a comb. The Down East Microwave units are much better.

3812. Performance of SGC Antenna Tuner on Motorhome??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-03 00:00:00 UTC
From: gbohner@aol.com
Message-ID: <50hush$12n@newsbf02.news.aol.com>
Source record: 194725

Does anyone have experience with the SGC Antenna Tuner for the ham radio bands on a motorhome? What is your configuration (vertical attacted to ladder, wire around the roof, etc) What is the size and material of your motorhome (aluminum or fiberglass)? Have you devised a good way to keep the overall height down or to lower the antenna for travel? What do you use for ground?

I would like to operate primarily 20 and 40, but also 75 and 15 meters. I have a 35' bus-style motorhome, aluminum sides, fiberglass front & back, rubber roof. It is somthing like 11.5 feet high, so there isn't enough room to mount a permanent vertical. I am kind of stuck for a good idea on how to put up somthing that will work, yet is easy to lay down for travel. Since the coach is 11.5 feet high, I can't just reach up there and flip it over or detach it.

Tnx in advance for your ideas.

Well, I was leafing through the May QST in the "reading room"
a while ago and noticed that they *were* including T/R time
measurements in their radio reviews (the 2m HT "shootout").
Looks like they may have been paying attention after all. No
BER numbers in this article though, but I suppose they assumed
we wouldn't try to use a 2m HT for 9600 baud. (I wouldn't.)

From what I remember in motor class. A motor will take 3 to 5 times its' running current to start. Three or four revolutions of shaft. The generator/alternator needs to be able to produce that current (surge). That is one of the ratings of most generator/alternators- surge or intermittent max current.

Jean-Pierre,

Although I realize that your intentions are good, the end result is that you are using non type accepted radio
for commercial use. That is illegal according to Industry Canada.

I would highly recommend that you seek out and purchase a second-hand HT which would probably do the job for

you much better than a de-sensed Amatuer HT. You can find a broad list of available equipment on the newsgroup
rec.radio.swap.

I beleive that from a purely finacial standpoint, you may want to consider this because trying to put a DPL
board into that radio with a switch my cause you more grief than it's worth.

You understand however, that this is just my opinion!

Best Regards Jean-Pierre!

I've started a new Amateur Radio Club at the University of Nebraska at Omaha. I'm looking for basic equipment to get on the air as well as any equipment that can be used to set up a 2m,440mHz repeater station. Please help with a tax deductable equipment contribution to this club. A receipt and a tax id number will be provided for all equipment donated.

I can be contacted at quigs796@cris.com.

3828. Kenwood TS-870 vs TS-950SDX????????

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-03 00:00:00 UTC
From: "Anthony C. Cash" <tonycash@worldnet.att.net>
Message-ID: <322CFBEC.1EEC@worldnet.att.net>
Source record: 194741

Hello All,
I am going to be buying a new HF rig soon. I was looking at the
TS-950SDX. Then I noticed the new TS-780.
What makes the 950 worth $1400.00 more than the 780. From what little I
have read it looks to me like the 780 might be a better radio for LESS.

Anybody out there got any good comparisons??

Thanks in advance for any help you may send me.

I like the heck out of my FT-51, but I wish it had a simpler DC power input jack. Otherwise, it is a very good performer, and on various field exercises, seems to outdo the Kenwoods and Alincos most of my club's members are using. OTOH, I don't see that the dual rcvr and X-band repeat features are much of a big deal, and it costs like $100 more than the FT-50.

FT-51 has a very nice programmable display, which can be used to put alphanumeric codes for the programmed channels. That is a major reason it (and the FT-8500 mobile I bought) was my choice. People always comment on that feature when they see it. I have the name of the sponsoring radio club or the city for each freq stored, and it saves many lookups or embarrassing calls on wrong machine.

I believe the Yaesu HT's are well made, but have not owned other models.

Message-ID: <f54_9609041101@woodybbs.com>
Source record: 194749

I'm not sure if this is the right sub or not, but i'm gonna shoot for it.
I have the Radio Shack HTX202.
Pretty good radio when I bought it. I could get plenty of repeaters and work SSB. Well, I had been living in a 3rd floor apt and was given the chance to move down to a 1st floor. That was great for me and the kids, no more stairs. But, the location of the apt had made me think about my ht. The apt was stuck in the back corner of the building. I told my landlord that I would have to think about it due to my hobby and gave him a good explanation. He said,'Well, tell ya what. I'll let you in the apt, and you can bring you radio in and see how it works." I said ok, but if it doesn't work, I won't take the apt. Hmmm, turn down an apt for a radio?? Strange. Anyways, I went in with the landlord and fired up my ht, threw out my call and asked for a signal report. Kd1yd came back with a very good report for me. Said I had the best transmission he had heard from me in a long time and that I was actually full dfq for once. Boy was I thrilled! well, moved into the apt, making sure my ht was the last to go so it wouldn't get banged up during the move. Got settled in and set my ht on my desk. A couple days later, i fired it up and threw out my call and got no response. So, I just set it down and waited. Two days went by and I didn't hear a sound. I threw out my call again asking for anyone on. No answere. This time i noticed I wasn't even getting the repeater tone. Flipped over to another repeater and asked if anyone knew of any problems with the Mt. Tom repeater. Everyone said no. Called a friend via landline and he also said no, in fact he was on 94 at the time I called.
Well, I started thinking something was strange. Maybe the great transmission i had was a fluke, So I took my ht out to several places where I knew that i could get out real good. Still nothing. No squeeks, white noise, tones or nothing. I borrowed another radio from someone and retried at home. no problems. Transmission was great. Tried mine again at home and several places, nothing. Well, needless to say, I came to the conclusion that my ht is dying. Of all the repeaters I was able to hit, the only one I can get now is the 67 machine. Not even sure if I can do ssb anymore. Sorry for the long story, nut figured it would be a good idea to give the cercumstances behind where my trouble started.
In any case....does anyone at all have any idea what might be the problem and have a way to fix it. I really can't afford to send the radio out to be fixed and not really good at something like that myself, but willing to try. I miss my ht and miss being on air. It's been like this for several months now and I need to do something. Any and all help is greatly appreciated.
I thank any and all for responding

Hi !
I Have not heard of any soundblaster version.
There is a simple modem with one OPAMP available. The program is called
HAMCOM and available on several FTP sites.
But: If you really want to do RTTY, you should get a hold of a
filterconverter. In Germany one after DJ6HP is quite commom and working
very good.

From: barry@w2up.wells.com
Message-ID: <kTHNTD1w165w@w2up.wells.com>
Source record: 194848

Recently, the pilot light on the S-meter in my FT-227RA blew. AFter
opening (and reclosing) it, now the freq dial doesn't work! If I use the
up/down buttons on the mic, I can change the frequency, but not by the
dial on the radio. Has this happened to anyone else? Any ideas?
Yes, I know the radio is 20 years old, but only use it for packet now,
and would like to fix it, if relatively simple...
Tnx/Barry

Hi all,

I have an old Yaesu FT-227R Memorizer and the lamps for the "Memory" and "Memory Recall" have recently burnt out. I opened the rig in hopes to quickly replace these lamps, but it appears that these lamps are held in place with wax (or some sort of material).

Does anyone have any ideas on the best way to remove and then replace these lamps? Are they in fact held in place with some sort of wax or rubber cement?

Your suggestions will be greatly appreciated.

Hi Gary, Tim N7XAU here. I just bought the Alinco DX-70 HF and 6 meter all mode radio. Its a great radio, it doenst have the 2 meter section like the Icom 706, but its also about $400.00 cheaper to. I didnt need the 2 meter section as I already have dual band (2meter,440) radio's in the shack and mobile. You can get them for $799.00 at Tucker Electronics, they have a web page. I used the radio this weekend at our annual club event, we operate at a place in AZ called Paradise, we connect with other places like, Hell,Mich. Purgatory,CO. I made about 50 contacts with my radio on 20 meters, I was only able to stay a couple of hours, and had many 5/9 reports using a Hustler 4 band verticle mounted on the back of my Blazer. It also has the removeable front which is nice for mobile use. I have also made several contacts on 6 meter SSB, its kind of dead right now, but when the sporadic E starts it opens up pretty well. Well just wanted to put my two cents worth in, hope it helps.

73s de Tim N7XAU

3847. Color Printer?

Im not sure what you are reading into my post...the "best equipment money can buy" for 9.6k packet, does not equat into the "most expensive"...please read agin...that is not what I said.

I find it interesting that a fellow ham entering new territory, attempts to do the best he can, with equipment advertised to do the job, is labled "ignorant" by his peers.

> Gary Coffman KE4ZV

Gary, they (the ARRL) have been advised of their omission in testing for time delays and so far they have not responded. At the ARRL Digital Ccommunications Conference last year in Texas, my DRSTM (Data Radio Standard Test Methods) project was presented as a paper. Jon Bloom from the ARRL Labs was in the audience and during the discussion following the presentation stated that he thought that the tests reported in QST did include timing tests. A few days later he contacted the presenter and confirmed that there had not been any such tests conducted. They expressed good interest in the DRSTM project. A complete copy of the

final proposed test procedure document was forwarded to them in Jan of this year. So far no comments or even acknowledgement of receipt has been forthcoming. A follow up message has also not elicited any response. It makes one think that they are not really interested.

The BER test while an excellant SCREENING test for data handling characteristics does not in any way indicate the cause or the cure to any problems that might show up as a poor BER. Likewise a minimum TXD test is only useful as a screening test for switching times. If the Minimum TXD is high, it cannot in any way indicate the cause or cure for the poor switching times. A BER test alone (like the ARRL labs have been doing) can only be of use where data systems operate full duplex with 100% key down transmit. How many such amateur radio data systems are in use worldwide????? More than the fingers on your hand???? Maybe

Interestingly the person from TAPR who responded to the proposed test procedures made the statement that in his opinion the only really important test necessary was a BER test. That shows a similar lack of understanding of the problems. Maybe these guys have been spending too much time in the lab and not enough time in the real world.

I converted my SB-200 for 6m, not knowing that the 572B tubes would require 50-75 watts of drive to produce about 600-700 watts of output on 6m, and only having 10 watts of drive from my Icom 560, so now I need to reconvert it back to 80-10m HF.....I call Heath Co for the parts (40m) input coil that had to be changed for 6m....NO PARTS ! Can someone tell me how meny turns and what size wire is on the 40m input coil to the AMP. I thank I can sale the amp faster as a HF AMP for $300.00 then I can for a 6m AMP only.

Of *course* he's ignorant, Christopher. What else could he be when
entering a new field? Everyone starting out in a new area starts out
ignorant. But ignorance can be cured, and that's what Rob and Dana were
trying to do for you, cure your ignorance and try to prevent you from
passing it on to someone else who is ignorant. Ignorance doesn't equate
to inability to learn. That's what the tag *stupidity* is reserved for.
If, after you've had it explained to you in excruciating detail why your
choice is faulty, you continue to defend the faulty choice, then *that*
is stupidity. And alas that *is* incurable, so there's no use wasting
any more effort trying.

The original question was "are there any rigs from the big commercial companies that will work 9.6k packet?" (not a direct quote from the poster)

I answered that a (my) tm-451a "will work 9.6k packet", so the answer was, and still is, yes. I also included the TXD in the post, as to show how efficent that rig is.

Now here are some added points...

Does the 451a work on 9.6k packet...yes.

Did I answer the original question correctly...yes.

Are there better radios than the 451a for 9.6k packet...yes.

Is it true that a 250ms TXD does not utilize 9.6k packet effectively...yes.

Did I already know all those things...yes.

This whole thread was a forum for some who wish to pick apart my every post, and move away from the original issue...which was the question that I answered correctly.

Take care Gary.

3860. Good dual band ht ?? Suggestions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-03 00:00:00 UTC
From: Ed <etroy@aeroconsult.com>
Message-ID: <322C540A.254F@aeroconsult.com>
Source record: 194867

My Kenwood TH26AT gave up the ghost, so it is time to look for a new unit, this time a dual band unit. I'm looking for something that is as versatile as possible, so that I can use it for mobile, with packet, APRS, etc. I am considering the FT-50R, as it looks to be about the most versatile, and it seems to have a reasonably good reputation, although I have never owned a Yaesu radio.

Any opinions on any radios, good, bad, or indifferent???

Sounds interesting to me.. I have an MFJ Tuner that works great!!! Get
one of these so if the SWR meter is showing high SWR's you just tune the
signal and get LOW SWR's. However, I wouldn't go out and spend the money
until you find out if the SWR meter you currently are using is screwed up
with a short of something.

3864. TCS/TDE transmitter/receiver combo?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-04 00:00:00 UTC
From: nyoung@desire.wright.edu
Message-ID: <1996Sep4.084657@desire.wright.edu>
Source record: 194621

At the '96 Hamvention, out in the flea market, at thee end of one of the rows near the Hara arena, someone had a Navy TCS transmitter and receiver set, on vibration mounts, with all the dials on it and whatever. I saw the thing on Saturday and thought about it that evening.

When I went back the next day, the vendor had left and no one knew what I was talking about. So either I imagined that I saw those boxes of stuff or it really happened and I wasn't smart or fast enough to grab it.

Thus: I'm looking -- in a less than casual but not in a heated way -- for a matching, working, transmitter & receiver combo of the TCS radio system. It was still in the RM2 &3 manual when I was in the Navy some 25 years ago. Sure wish I'd picked that puppy up at Dayton. I could have added it to my collection of weird old radios. Some day my kids will be trying to figure out what to do with it at the estate auction. In the meantime, I"d like to bother neighbors and act like a salty dog with such a beast.

All:
I am looking for a portable radio with a built in dual cassette recorder and player that has input controls. That is, one doesn't have to rely on ALC (automatic level control) but can control the amount of signal going from the radio to the cassette or from one cassette to the other. I had one like this but it was stolen from me and I don't know the maker of it.

Thanx,
Keith

Yes, EZ Clone does support the Kenwood TH-79A(D). It will be ready
this autumn. Once that rig is supported, we will have support for the
TH-79E (European model) shortly thereafter.

The club I belong to is considering replacing the ACC controllers we have with new ones. It appears this will be very expensive and we don't want to make a mistake. We are leaning towards the LinkComm (sp?). I would really like to get any comments you may have either pro or con on this controller or any other (SComm). One of our repeater sites needs a robust and feature rich controller as we have a 2m repeater linked to 2m, 6m, and 10m remote base systems, as well as an auto-patch. We would like to continue to offer reverse auto-patch, DVR, and voice mail as well. Thanks for your comments.

Source record: 194634

I've owned my 78A for some years now. Dropped in the extra mem and did the mod.

But now the tuning knob is stuck!

It will turn to the right, but will not turn to the left (down, sequentially). Kenwood factory guy said I need a new encoder...$18. They'll fix it for about $50 labor on top of that.

I'm hoping to do this on my own, however. Can anyone advise me on this repair job? I'm not even sure where the encoder is. Is it a relatively easy job, or should I pay the $70?

You may e-mail me. Thanks in advance!

Tim Shaner KE6BVC

>I'm looking for people using TEKK-900 or TEKK-960 radios. Please write
>me you experiences!

I've got a couple of KS900s. There isn't much to tell. Wire it up
to the TNC (D connector on radio), hook on an antenna (BNC on radio),
feed it power (*must* be less than 11 volts, I use 9 VDC regulated),
it works.

There are a couple of things of note. *Obey* the power supply
voltage limit. They aren't kidding about keeping it below
11 volts. And if you don't have a spectrum analyzer handy,
let the factory crystal it up and tune it for your frequency.
It's easy to get a spectrum like a comb out of this thing if
you tune it wrong.

Gary

Hi Tony,

Apart from the rather great price differential between the TS-870 and the TS-870SDX, the choice depends largely as to which of these rigs' features are of greatest importance to you.

There have been some complaints (but largely based upon supposed or imagined theoretical grounds) that the analog IF section of the TS-870 is an open invitation to overloading from close-in multi-dB over S9 signals. I have not found this to be the case, however. For ordinary amateur operation, Kenwood's analog/digital IF section of the TS-870 is a very welcomed advance --- and certainly points the way towards newer designs down the road. If received audio quality is important to you, the TS-870 is probably unbeatable by any other rig currently available.

One must be extremely careful in making genralizations of a rig based only on personal experience... but it is my impression that the transmit IMD of the 870 leaves much to be desired. I feel that the SSB quality is quite compromised whenever more than the slightest amount of ALC is being generated. Consequently, I always keep the ALC just at the threshold. If you intend to use either the SM-220 or SM-230 panoramic displays, you'll find that the display is "blind" to any signal 10 kHz above the dial frequency (this is not true for the SDX). The power output is limited to 100 watts; but at this power level IMD is quite poor. IMD improves considerably by just limiting the power to 90 watts or less. But the TS-870 is a frustratingly very exciting rig to play with --- and is probably worth what they are asking for it.

The TS-950SDX, however, exudes quality. It's main drawback is that a number of the rigs have developed soldering problems associated with CP-1/4 in the DDS circuitry. But once corrected (if required), you have a truly outstanding rig.

The transmit IMD is commendably low (and varies only slightly with different power settings). It has dual receive which works quite well. The built-in monitor provides a very accurate indication of your transmitted signal (unlike the very frequency-response-limited monitor of the TS-950SD). The rig can easily produce 150 watts from the output FETs. It is my impression that production of the TS-950SDX ceased some time ago (does anyone have info to the contrary?)... but this shouldn't be a consideration unless you are insistent upon waiting for the very latest.

My experience with the SDX far excedes that with the 870.

If you have any specific points you would like to ask, please feel free to send an e-mail. Since I am personally "obsessed" with signal quality, my vote still goes for the SDX. But, with the limitations I've alluded to for the 870 --- it is truly a very exciting rig for the money. I've no personal experience with the FT-1000MP, but I suspect that it should also be considered in this price range.

Oh... one last point that I nearly forgot. The audio-level DSP (that is, the DSP that tackles received heterodynes and noises) is not to be found on the SDX. I suspect, however, that if this is important to you, one of the many commercially-available outboard DSP units would provide better performance than what you will find on the 870. There has been more than considerable confusion amongst amateurs as to just exactly what did Kenwood mean when they first introduced DSP: The DSP of the 950SD and the 950SDX did not address received heterodyne/noise issues; it was strictly a means of combining phase/digital technologies for the generation and demodulation (only in the SDX) of the transmitted signal (primarily, SSB) --- the unwanted sideband with this technology is removed through mathematical procedures rather than through the "guillotine" approach of the conventional analog filter. In this regard, the 870 is very much like the 950SDX.

Regards,
Keith (KS9C)

3881. wish recomendations for 9600 LAN

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-04 00:00:00 UTC
From: jane@ifi.uio.no
Message-ID: <50kkgs$ecj@ratatosk.uio.no>
Source record: 194638

Hello.
At our local radio amateur club (LA1AD) we are planning to set up a
TCP/IP LAN with Linux. So far, we are planning a central site with two
or three ports 1200bps 2m 9600bps 70cm and maybe 300bps HF (or 6m)
In addition to this, two of the members will have a node at home, runing
TCP/IP on 9600 70cm.

We have been looking into the need for equipment and we have sort of
come down to a list of what we think is neccessary:

For LC1MAT:
(Have TM 733 radio for 2m/70cm 9600 and PC)
Ottawa PI2 card with 9600 bs modem

For LC3ZAT:
(Has PC)
either Ottawa PI2 card with modem or mulitimode TNC.
(Would like to have the opportunity to use it with APRS and HF amtor/RTTY)

For LA1AD:
(we have a PC 486-33SX /8MB, and 2m/HF trancievers)
1 TEKK radio for 70cm 9600bps
1 Ottawa PI2 OR Baycom USCC4 card
1 9600 bps modem
1 1200 bps modem
(1 300bps HF modem)

The disadvantage with this setup is that the Ottawa card only has two
ports, and the USCC4 is rather more expensive. This also means that the
radio group will have to buy a lot of equipment which it can't affort, and
the group radio shack is not very well protected from intruders.

A different solution would be to have only a 9600bps 70cm port on LA1AD,
and a 1200bps port on LC1MAT and a HF port on LC3ZAT, but this would
require some difficult routing setup, and might violate the rules for
installing digirepeaters without a special licence. Is it possible to
have some sort of digipeating here even when the PC's are shut down?

A very cheap solution would be to buy two serial baycom modems and a
paralell baycom modem for LA1AD, but would this work on this PC running
Linux? Efficiently?

Can an Ottawa/USCC4 card run 300bps packet over HF? Do we need Frequency
shift Keying? or does the 300bps modem implement this?

Is there software for Linux to do APRS? (Amateur Position Reporting
System) With an NMEA GPS.

Can these Ottawa/USCC4 cards run any other digimode?

Is there any particular problems with running HF packet, i.e. on the 14MHz band?

Are there any problems with 9600 bps modems from different producers talking to each other?

Would a dual port TNC be very muc better than an Ottawa card? Very much more expensive? WHat should we go for in that case? We have been looking at the specs for PK232MBX, KAM Plus and DSP-232, of different price classes and different configurastions. Could any of these digipeat between UHF 9600 and HF 300? on the AX.25 level? on the tcp/ip level? (Without a PC attached)

As you understand, we are not very experienced in this field, and we hope Somebody will give us some advice and share some of their experience with us, so we don't do all the great mistakes that everybody has done before us...

I am looking for either model. Must work perfectly.
Here's what I have to trade:

-Phone/Modem/Fax/Sound Card: Diamond Telecomander 3500XL Professional Voicemail System, 28.8 Internal Fax/Voice/Modem, CD Quality Multimedia 16-bit Sound, Full-duplex speaker phone, Jumperless Automatic Installation. Soundblaster compatible. Midi/Joystick port, $150

-Video Card: PCI Movie Video card, VideoLogic, 2 meg onboard Vram, 16.7 million colors, Weitek Power 9100 graphics controller, works with Windows 95 (or Win 3.1) refresh rates up to 120 hz, full screen movies, ideal for CD multimedia titles, 16x faster Windows performance, 24-bit true color, resolutions up to 1280x1024, upgradeable with a VESA Media Channel (for video conferencing, mpeg playback or other). $125

ELECTRONICS
-2 meter handheld, Radio Shack HTX-202, New in box, never used! Comes with standard NiCad battery pack, and empty battery pack for rechargeable or disposable AA batteries and AC adapter ($259.99 new). ALSO has extra never-used NiCad pack ($39.99 new) and Speaker/mic ($19.99 new). Receipts for $346.20. Asking $275 for bundle.

-2 meter mobile, Radio Shack HTX-212, new in box, never installed, never used, 45-watt, 2M FM mobile transciever with intermod-fighting receiver front-end. Built in CTCSS encoder and decoder, DTMF page with group calling, 6 DTMF memories, 30 memory channels, extended 136-174 range, MARS/CAP capability. New for $349.99 (receipt for $378.69), asking $300.

-Car CD Changer, Pioneer 6 CD changer. Uses standard Pioneer CD magazines, comes with at least 3 magazines. Works great. Must have a Pioneer receiver made to control the changer. Asking $170.

-Pocket LCD Color TV (Pocketvision 30), 2.5" active-matrix for rich, high-resolution picture, digital tuning, telescoping rod antennae, built in speaker and jack for earphone. Has AV in jack (perfect for use with camcorder for playback instead of using eye-piece on camcorder). Sells new for $229.99, asking $150

-TV, B/W 13", works great. Clear picture. Older model. $20.

-TV, Color 15" RCA, great picture, very reliable, older model, works perfectly. $40

-Radio, receives AM/FM/TV, General Electric Model 7-2930B, earphone jack, uses 4 AA batteries or included wall cord. $15

-Radio, receives AM/FM/TV & Weather, Emerson Model PM3909, earphone jack, uses 4 C batteries or included wall cord. $18-TV, B/W 13". Works fine. $15.

-Remote Control Pickup, Nikko brand, custom military paint job. Looks great, runs perfect, needs no work. 2 channel full function remote 27mhz, low & high gear, two 7.2

Ni-cad batteries, quick charger. $40.

-Antennae, cell phone, "On Window" 5 dB Gain Cellular by Mobile Mark (model OW-5-900). $5.

-Wire & circuit tracing system, Brady Pathfinder 12-A, Can identify 12 circuits at a time. Use simple procedure to eliminate time and cost of retracing when re-wiring provide extra margin of safety. for Perfect for tracing phone lines, auto wiring, antennae leads, much more. Works perfectly. Use imagination :) $50.

-Coffee Maker, Mr. Coffee 12 cup, black, very clean, with filters. $5

-DustDevil Plus vacuum and attachment kit. $25

MISC
-Coat, Original Australian Outback Oilskin Coat, Medium, black, New for $165, Asking $70.

-Flight suit, Military issue CWU-27P Polyamide high temperature resistant, sage green. Size 36-R. Great condition. New for $125, Asking $20.

SOFTWARE
-PC Study Bible 1.7 for Windows on 3.5" disks with the following add-ons:
1. New Exhaustive Strong's Greek-Hebrew Dictionary and Englishman's
Concordance, 2. Definitions from Thayer's Greek Lexicon and
Brown-Driver-Briggs Hebrew Lexicon 3. Interlinear Bible
4. Living Bible 5. Treasury of Scripture Knowledge 6. Matthew
Henry's Commentary 6. Bible Maps ....Asking $75 for bundle.
-Corel WordPerfect Suite 7 for Windows 95, 32-bit Office, Graphics & Internet Power. Corel WordPerfect &, Corel Quattro Pro 7, Corel Presentations 7, CorelFLOW, SideKick 95, AT&T WorldNet Service, Netscape Navigator 2.01, Dashboard 95, Envoy 7, 150 fonts, 10,000 clip-art images on one CD Rom, never opened. Sells for $298, asking $175.
-ECCO Pro 3.0, Personal Information Manager, calendar, phone book, dynamic notes, outlines, folders, "shooter," and more for Windows on 3.5" diskettes. $35
-Romantic Adventures, A practical and fun software package that will help you manage and improve your intimate relationships. Complete with romantic ideas, a journal for tracking, helpful hints. New for $58.01. Asking $15.
-Diet, Menu Planner for Windows on CD, $10
-Diet, Weight Loss Planner for Windows on CD, $10
-Diet, Executive Diet Helper for Windows on CD, $10
-Game, TerraNova "Strike Force Centauri" 1996, $18

JEWELRY
-Ring, USMC Diamond/Gold/Onyx men's, 10k & black onyx with 1/3 k. diamond, Jostens, lifetime warranty & re-sizing . (new $950) - $375.
-Watch, Military Field Watch, stainless steel, black face, quartz accurate, water resistant, web black band with leather uppers and lowers. Shows day and date with second hand. New for $89, asking $25.
-Watch, Swiss Army "Wenger S.A.K. Design" stainless body with white face and black leather band. Displays military hours, shows date, second hand. Water resistant 100 meters. New for $119. Lens is scratched. Asking $25.
-Pendant, Pewter Raven pendant, 1.25" round two-sided, hand carved. $15
-Pendant, Pewter Raven pendant, 1.5" round single-sided. $15

-Pendant, Pewter Raven pendant, .8" x 1.25" rectangular single-sided. $15
-Pendant, Pewter Raven pendant, 3.5" two-sided. $15
-Pendant, Silver 1" Raven holding .5" onyx marble pendant, single-sided. $15
-Pendant, Silver globe w brass continents chime pendant. (Chimes inside of ball). $18

POLICE/SECURITY/GUARD Equipment
[All duty gear is NEW and matched set of Nylok 950 Denier weave]
-Case, for cell phone, for duty belt, (for Motorola flip phone), foam padding and Velcro flap, uses "rip-offs" clip. (Paid $17) Asking $8.
-Flashlight, MagCharger flashlight (Made by Maglite), comes with AC & DC charging, five cell battery stick, high-powered halogen bulb for 30,000 CP, lifetime warranty, no scratches, no damage, new in box. (Paid $150) Asking $80.
-Jacket, Hidden Agenda Jacket, Supplex (tear resistant) Nylon Jacket has hide-away custom ID panels, looks like an ordinary black jacket, but simply reach up and pull down the hidden badge flaps (over right & left top pockets and on back). Panels are replaceable and can be customized. Size is 36-39. Great condition. (Paid $125) Asking $65.

CHRISTIAN MUSIC CD's: $6 each
-Johhny Q. Public "Extra-Ordinary"
-Grammatrain "Lonely House"
-Acappella "We Have Seen His Glory"
-Hosanna Music, "Glorificate" Praise in Spanish
-Julie Miller "He Walks Through Walls"-Glad "Floodgate"
-First Call "Sacred Journey"
-Darrell Mansfield "Get Ready" & "Give Him Your Blues"-Lanny Cordola's "Of Riffs and Symphonies"
-Lost Dogs "Scenic Route"
-Larry Howard's "Cornerstone Blues Jam"
-Bright Star Male Chorus "He Will Answer Prayer

Thanks for glancing through all this stuff. Everything is in good condition. I'm selling everything I can live without for student loans.
Feel free to E-mail me at ron.in.seattle@pobox.com or leave a message at (206) 997-7871.
Thanks in advance.

We, the Ventura County ARES Area 6 Packet Radio Training Group have created a download-able version of our manual on the World Wide Web.

Our course includes the Kantronics KPC-3 TNC and Tony Longsdale's paKet 6.1 software.

We hope you enjoy the manual as much as we have enjoyed putting it together, and please feel free to pass it along to all interested in packet radio. It is our intention to make this material available to anyone who desires to have it. You may freely make copies and distribute
it, hold classes using it, modify it and train from it, etc.

We are giving this freely to the ham community to promote the free exchange of information and fellowship among hams. We hope you also see fit to pass it on in the same spirit. You will find it at:

http://www.fishnet.net/~dlmiller/packet.html

This is an HTML version of the hard copy reference manual which we use in
our Packet Radio Training Course.

For questions and/or comments about this web page or the class which we teach, please send a message to one of the following:

Hello!

You are invited to participate in the most exciting telecommunications
MLM opportunity! FreedomStarr Communications, Inc. (FCI),
proudly announces our "Share the Wealth" true residual income
program that will go RIGHT ALONG with any MLM program you're
participating in currently, and any business venture you undertake at any
time in the future. It's free! No Cost - No Work - No Risk! FREE
Web Page and a low-cost Internet Package, plus more!

As an FCI representative, you have the chance to build a truly long
term, year-after-year, monthly residual income, with minimal effort. With
the TOLL FREE, 24 HOUR AUTOMATIC VOICE MAIL SPONSORING SYSTEM,
you may build an EFFORTLESS, UNLIMITED RESIDUAL INCOME in the
$100+ BILLION per year telecommunications industry.

Imagine earning a steady, long-term, monthly residual income check
from the long distance telephone usage of THOUSANDS of other
people! If you were to refer just 4 other people to FCI by having them
call our Toll Free Recorded Hot Line, and they were to duplicate your
efforts, you will have built for yourself an ongoing monthly residual
imcome of over $4000!!!! (This is based on a smaill $20.00 average
monthly interstate long distance phone bill). You can imagine the
potential!!!!

And, here's the best part - our RECORDED INFORMATION &
REGISTRATION HOT LINE WILL DO ALL OF THE WORK FOR YOU!
Our state-of-the-art 800 Voice mail System can handle up to
256 SIMULTANEOUS CALLS from every state in the nation!

Call FCI's state of the art FAX ON DEMAND system first and see how
EASY and POWERFUL this GREAT once in a life time opportunity can
be! CALL the fax at 619-432-9700!!!

The Fax on Demand is less than 10 pages. You must use your hand set
and the fax must be in manual mode when you call.

This means that this program is perfectly suited for the ELECTRONIC MARKETING that you could or and ALREADY doing.

$$$ Call the FREE information HOT LINE NOW to find out how to get your ID# registered FREE! and find out more about this one in a LIFETIME GREAT OPPORTUNITY! It's a FREE call, and it's FREE to join! What do you have to lose! $$$$

1-800-223-6477 (Sponsor #: va1123581)

Your FCI ID# consists of the FIRST 2 LETTERS of your LAST NAME, followed by the LAST 7 DIGITS of your social Security Number. For Example, if your name is Tom James, and your SS# is 123456789, then your FCI ID# would be: JA3456789 (NOT TJ3456789).

After your registration phone call, you may IMMEDIATELY begin referring others to the same toll free phone number, and get credit for those referrals, through 6 computer-tracked levels of your growing organization. In 2 to 3 days, you will receive more information, registration forms, and a sample FCI glossy brochure in the mail.

Every month, you may receive a printed down line report showing every person who has called using your sponsor ID#, and every person signed on from levels 2 through 6.

This is the OPPORTUNITY OF A LIGETIME! You'll be one of the FIRST 1000 PEOPLE IN THE U.S.A., which means that your chance of earning a SERIOUS MONTHLY INCOME in a very short period of time is very realistic! We are looking for individuals such as yourself, to reach our goal of 50,000 representatives by January 1, 1997.

Here was the clincher for me! U.S. Residents note: In order to be a part of this outstanding program you DO NOT have to switch your Long Distance sservice to FCI, if you are getting a better rate, or the phone is not in your name, or for whatever reason you have. (You can prove a better rate by submitting a photocopy of your bill). If your are not switching carriers you only need to remit $20 (annually) for YOUR monthly down line report.

MORE INFORMATION FOR YOU:

Overview: Who is 1)WilTel, 2) UniDial, and 3) FCI?

1) Founded in 1985, WilTel owns and operates a nationwide fiber-optic network, on of only four in the United States, with access to more than 30,000 system mils. WilTel pioneered the techinique of pulling fiber-optic cables through decommissioned oil and gas pipelines. This approach results in the most secure routes in the industry, and as a result, over one half of the U.S.A.'s Fortune 100 corporations trust and utilize WilTel as their long distance carrier. as a full service telecommunications company, WilTel provices data, voice, and video products and services worldwide and is currently the fourth largest long distance carrier in the U.S.A.

2) UniDial, Inc. is the largest re-seller for WilTel, having signed a $480 million long-term agreement on June 5th, 1995 - the largest ever in re-seller history. this strategic partnership demonstarates UniDial's aggressive plan to penetrate the re-seller market, which is growing by leaps and bounds. In 1994, the re-seller industry reached $8.25 billion, and is expected to increase to more than $12 billion by 1998.

By taking advantage of UniDial's massive buying power, individuals such as yourself now have access to a fabulous new long distance rate. If you are currently using AT&T, MCI, Sprint or onne of the other long distance services you might by paying as much as 27 cents per minute for your long distance calls.

You may now call anytime, for 12.9 cents per minute (Interstate) with absolutely no minimum commitment and you don't have to wait until 5:00 pm to get this great, low rate! Also, there will be no change in the way you place a long distance call - just dial 1+ the area code and phone number.

The UniDial "Global Axcess" Communications Card is now available. Features include with the Global Axcess card are 800# Voice Mail, Fax Mail, international calling (at savings up to 55% savings over AT&T, MCI, and Sprint), Speed Dialing, and Coference Calling without an operator. You can use the Axcess card from any of over 30 foreign countries. this is what I call a company that listens to the needs of entrepreneurs like us.

FreedomStarr Communications, Inc. is a telecommunications network marketing company representing UniDial, Inc. Our firm provides marketing support and an ingenious distribution mechanism to a network of independent "customer/representatives" all over the United states of America.

FCI offers US citizens a very simple, yet powerful way to both save money and earn a substantial long term residual income in the exciting telecommunications industry, with very little effort aside from sharing a toll free recorded hot line phone number with others. Because of the simplicity of FCI's Share the Wealth program, no sales ability of experience is required. In fact, you may build your income without ever speaking with another human being! This revolutionary new concept is taking the nation by storm, and we welcome you and invite you to become a part of our success.

**** YOUR SUCCESS IS OUR SUCCESS ****

Motorola SaberIII UHF Securenet version (NO MODULE)
H44QXK7139CN
440-470 version - high power - scan - display- full keypad
In EXCELLENT condition inside and out.

Programmed all on amateur freqs

Comes with 2 brand new 1100mah moto batteries (621 MU)
2 1800mah mot batteries used in excellent condition
NO CHARGER

Will consider some kind of trade for either UHF 16 freq GP-350
or HT-1000 16 freq. UHF with 440 coverage.

Will sell outright for $600.00

3889. Kenwood S-meters

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-04 00:00:00 UTC
From: sbertsch@x1.us.ohio-state.edu
Message-ID: <50kta0$8go@charm.magnus.acs.ohio-state.edu>
Source record: 194646

I was looking at some new HF transceivers at Universal Radio and noticed that on the Kenwoods, the S-meter reads considerably higher in FM mode than on the other modes. In other words, tune in a steady carrier, on LSB/USB/AM/CW/FSK the meter reads the same, but select FM and it jumps up quite a bit. My old TS-440 does this as well.

Is this purposely calibrated differently for some reason?

My dad and I are new to the hobby, we passed our technician tests, and now we want to go have fun. We think we want an HT to start with, then a mobile, and then eventually a base station rig. As we are on a budget, does anyone have any suggestions/recomendations for a good starter radio? Thanks in advance,

>> I have heard of Hostmaster II+ and KaGold...

If anyone asks how KaGOLD compares to other software, consider these facts:

ANSI Graphics on ALL sessions, simultaneously with KaGOLD, including
automatic capture to disk. Not supported in Host Master.

Callbook Support -- four (4) CD ROMS (Amsoft, Buckmaster, QRZ, SAM)
and SAM disk based.

Conference Mode -- Automatic, Manual, Remotely Started

External User-defined commands that allow remote users to request
callbook data, start conferences, get files, list directories, and more

Runs in Windows, Desqview, OS/2, DOS, Laptops, Desktops, 8088 through
Pentium, 16550 UART support.

Now, here are some specific things you may want to compare:

Host Master resets and disconnects all stations when it starts up.
* KaGOLD retains connects, does not reset your tnc on startup.

Host Master will not exit in any mode other than PACKET, which means
you cannot exit and leave your ARQBBS on, or leave the unit in NAVTEX.
* KaGOLD allows you to exit in any mode you wish.

Host Master has small scrollback buffers. Default is 100 lines, and the
access to the scrollback is cumbersome.
* KaGOLD has huge scrollback buffers, all dynamically allocated, and
managed automatically.

Host Master has a very limited Help "system" (screen) with no help
on modes, or parameters.
* KaGOLD has a complete cross-referenced help system that covers all
parameters and operating modes.

Host Master uses a "command channel" to set and view parameters.
* KaGOLD allows you to set/change any parameter from any screen.

Host Master has a single binary file transfer system, and only
compatible with other Host Master users. Further, it uses a "pacing"
timer approach which is inherently unreliable.
* KaGOLD supports YAPP, RAW binary, and supports the same system as in
PkGOLD for the AEA PK-232 and PK-88 tncs, and other GOLD protocol
software (dspGOLD, KaGOLD for Data Engine, etc).

Host Master has no Conference mode, and multiconnects are difficult.
* KaGOLD has manual and/or automatic conferences, allows multi-node

conferences (mixing KaGOLD and PkGOLD conferences)

Host Master does not work reliably in Windows.
* KaGOLD runs under Windows, Desqview, OS/2, DOS 2 through 6, and
in VPIX under Unix for the PC. It is "multitasking" aware.

* KaGOLD -- Reliable, fast, user friendly, more features, the best!

3895. Help with Hy-Gain Hy-Tower

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-04 00:00:00 UTC
From: Andy <andy@vais.net>
Message-ID: <322E1277.363A@vais.net>
Source record: 194652

(POSTED FOR W3HM, WHOSE NEWS SERVER IS TEMPORARILY DOWN. PLEASE REPLY TO E-MAIL ADDRESS SHOWN AT END OF POST.)

I recently bought a new Hy-Gain Hy-Tower. I installed it per the manual with 54 buried ground radials and 6 ground rods. I was able to get it to resonate on all bands except 15 meters. The SWR was not that great but it did resonate.

Last evening it rained for the first time since I had the antenna up.I could not resonate it on any band. The SWR was very high. Does wet ground have such a profound effect on the Hy-Tower? Does anyone have experience it the antenna.

I contacted Hy-Gain and spoke with the chief engineer. His response was that the antenna has been around for 30 years and lots of people are successfully using it,and that the problem must be on my end. Two other hams have measured it and found no errors. Any suggestions?

PLEASE REPLY TO millsh@itsi.disa.mil

>
Brian,

FWIW, I have the HP Deskjet 660Cse and I've been VERY happy with it.

I've had it for quite a few months now, and I've gone through one B&W cartridge, but haven't gone through a color cartridge yet.

I consider it to be quiet, reasonably fast, and economical.

I use it under OS/2, using the OS/2 driver and using the WinDoze drivers provided by HP for WinDoze programs running under WinOS2 (OS/2's better-than-WinDoze support for WinDoze programs).

OS considerations aside, I think the HP Deskjets are excellent value in all respects.

Carl

May I recommend the Hewlett-Packard HP600C? It is inexpensive ($194.00 at CompUSA) and does breathtakingly beautiful printing. Check it out at your local dealer's - there is a demo print of a parrot that will surely impress you. Can't tell you how expensive it is to use though, since I haven't used up the original print cartridge yet. For that price it's not fast, but fast enough for home use. I use it with Win95 and it installed and performed without a hitch. A week or so after I bought it I was in a Radio Shack and saw they were having a "special" on some old, clunky, dot-matrix monochrome thing for $250 or so. Sheesh!

Coincidentally, it also replaced a Panasonic KXP-1124.

>in packet radio bulletins, and in QST (5/95) to explain that the equipment
>advertised as "9600 baud ready" actually isn't.

The 451a IS "9600 baud ready"...but it just doesnt do the job as well as some
other rigs.

>Also, it often seems that amateurs tend to believe such a claim in a
>commercial advertisement, and tend to disbelieve claims from their fellow
>amateurs who happen to have tried it and found it was not true.

I have never experienced this.

>This is unfortunate, and not only for their own wallet but also for the
>efficiency of packet radio as we all use it.

Actually, the money can be considered well spent by some.

One can spend $400 on a radio that can do voice, 1.2k packet, and 9.6k
packet...on ANY frequency of his choice, verses a $150 rock bound rig that
can only do one thing, on one frequency.

It really depends on the person, and how they intend to use their equipment.

>When a reasonably well documented article like the one in QST fails
>to hit the brains of the newcomers, we have a problem.

Are you slamming hams who dont get, or read QST magazine? Are you
saying that it should be some sort of requirement to read QST?

>Plainly stating
>"what Kenwood tells you is not true" is not going to make much impact,
>and I doubt any amateur is interested in going through a legal case
>against the radio manufacturers and distributors about making false
>claims in their commercial advertisements.

Very true. I cant afford such legal fees, however, if I ever bought equipment
that didnt do what the manufacturer claims, and they didnt make it right, not
only would I never buy anything from them again, I would spread the word on
them as well.

Take care.

>Does anyone know where I can find the proper crystals? How much do they
>cost? Aren't there certain specs on crystals that have to be met in order
>for them to work properly in a specific radio? If so, I would need to
>know these specs before ordering....

Try one of the following:

Crystek
Ft. Meyers FL
813+936-2109
800-237-3061

JAN Crystals
Ft. Meyers FL
800+526-9825

The phone numbers above are from catalogs which are several years old,
so they may have changed. It's quite possible that either or both of
the companies will have in their files the necessary information to
make crystals for your Tempo One. If they don't, you can send them a
schematic of the oscillator circuit and they can figure the parameters
from that. From these comments you can deduce that yes, a crystal has
to be made for a specific circuit configuration to work properly. As
for cost, I haven't bought any crystals for several years, but as a
wild guess, I'd say you're probably looking at $10-$15 each, maybe a
little more.

Good luck with your Tempo One. I have had one for 12 or 13 years.
Mine had 2 10 meter crystals when I bought it and I never felt the
need to add the others.

You guys are really wasting your time here. After all the discussion he still doesn't get it. It's unfortunate but this attitude reflects that of a significant number of hams - "I bought it so it must be good and since I have it now it's good enough. I don't care how it affects others". It's that attitude that keeps amateur radio stuck in the stone age. It's what makes 1200 baud packet run at 30 cps and 9600 baud packet at 120cps. It's the same attitude that keeps us from proliferating new standards at higher bit rates. But.... he's happy with what he's doing (I think) so let it rest. Just don't put a packet station on the same frequency he's on!

They probably consider it a "feature" that a few people don't like.
Standard Engineering Practice. There is never anything wrong with the
equipment only the people using it. Then they wonder why sales are
not what they expected and declare that the market is diminishing.

You'd think if they tested the thing they would have noticed. Hmmm.
Maybe I on to something??? :-)

>Is this purposely calibrated differently for some reason?

I think it may be related to the fact that the "S" meter (if you want
to call it that) found on the older Kenwood FM 2-meter radios were not
calibrated in "S" units, but strictly a linear 0-10 scale.

I believe that the FM mode does not lend itself to the same
traditional method of measurement as does AM/SSB/CW for signal
strength. It is relative, not an absolute value.

> I know nothing about color printers.
Not much to know. Simple idea is that there are two types. Thoes that you replace the ink cartridge and get a new print jet (i.e. Hewlett Packard) and those that you refill the ink and have to clean the print jets. Personally I lean to the HP type. The other thing to watch for is those that use two cartridges, one for colour and one for black, and use the appropriate cartridge depending on what you are printing and those that you have to switch the cartridge. If you have children or a wife who doesn't understand anything technical (at all, like mine) then opt for the ones that use both automatically.

The HP 560C works fine. It's the older model and if you look around might find one. The newer version the 660C has a cheaper list and is a very nice printer. Now if your feeling rich the get a HP 820cxi...GREAT printer. I use a 560 at home and have an 820 in the office.
Quality is more dependent on the paper you are using. The better quality is more expensive. Xerox has come out with a cheaper ink jet paper that's about six bucks per hundred, quality is fine for most stuff. If you spring for one of the newer 800 series then the quality is very good on regular paper.

> I am interested in any comments about
> color printers for Win95...

Any printer will work with 95, it's just a question of having the right driver
Hope this helps!

Not withstanding it is impossiable to install DPL into a phase modulated radio. It really needs to be direct FM modulated for DPL to operate properly. It is real doubtful the board with DPL will even work in the IC-2GXAT. Purchase an IC-F30LT, it has CTCSS and DPL also can have a man down switch.

If you have web access, point your browser to:

www.sarrio.com

I ordered a TR-7400A Service Manual from them (Raymond Sarrio Company), as well as a number of other manuals (also older 2 meter radios) and received good clean copies of the original manual, all schematic pages are copied TWICE (very nice touch) and received them PROMPTLY!

I can highly recommend their manual service, and they have quite a large list of manuals for older amateur gear. You can order it toll free and also on the web.

3932. WTB: Junk box stuff!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-05 00:00:00 UTC
From: zommbee@nwlink.com
Message-ID: <50li8o$6oa@texas.nwlink.com>
Source record: 194672
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi.

I am looking to buy 'junk box stuff' to help replenish my shop. I have been out of ham radio for 12 years, and in that time most of my RF related parts have disappeared. I used to tear apart old transmitters and receivers to get coil forms, toroids, variable caps, and the like but most of those rigs are now collectors items, even in non-working condition.

I much prefer to use 'old' used parts, rather than constantly dig out the 'DigiKey' catalog to buy new ones.

What I am looking for is coils, coil forms, variable caps, remnants of old homebrew projects and long-dead rigs that have useable parts left, etc. Tubes, (!), sockets, verniers, pots, etc. (Transformers weigh too much to ship!). But mostly after coils and other RF components or portions of old gear.

Not the 'new in the box variety', but the old scraggly but ueseable stuff that makes junk boxes famous. Maybe in $10, $20 or $50 'grab bag' assortment boxes, or whatever works for you. Don't go to any bother - just misc parts and remnants in a box. Don't bother to itemize - just a basic description of what you have, and I'll trust you. (I think hams still do that!)

email what you have to:

Hello Eveybody,
I am looking for a HyGain tape measure dipole antenna. This antenna
is actually two tape measure built into one piece, including the
feedpoint. All you do is pull out the apporopriate amount of tape to
operate on your frequecny, and you are on the air!
If you, or anybody you know, has one of these antennas for sale,
please E-Mail me as I am interested in taking it off your hands!
Thank!
72/73,
Brian, N5ZGT

Hello all,
I was wondering if anyone has wired a Turner +3b microphone to
a HT? I have two Turner mikes sitting on shelf collecting dust from
my 11m days and I would like to put one of them to use with my Yeasu
ft-11r HT.

Are there any books (or web documents) that I could turn to for
information regarding wiring diagrams for the microphone? Is this
wiring feasible? Any help would be much appreciated...

Thanks! and 73's...

This works, I did it and have already received $682.00 in the past week.
****
Hello! I've got some awesome news that I think you need to take two
minutes to read if you have ever thought "How could I make some
serious cash in a hurry???" , or been in serious debt, ready to do
almost anything to get the money needed to pay off those bill
collectors. So grab a snack, a warm cup of coffee, or a glass of your
favorite beverage, get comfortable and listen to this interesting,
exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!. I
found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes
like multi-level marketing, mail-order schemes, envelope stuffing
scams, 900 number scams... the list goes on forever. I have tried
every darn get rich quick scheme out there over the past 12 years. I
somehow got on mailing lists for people looking to make money (more
like 'desperate stupid people who will try anything for money!').
Well, when I was a teenager, these claims to 'get me rich quick'
sounded irresistible! I would shell out $14.95 here, $29.95 there,
$24.95 here, and another $49.95 there. I had maxed out my new Circuit
City Card AND my Visa...I was desperate for money!! So, I gave them
all a chance but failed at every one of them! Maybe they worked for
some people, but not for me. Eventually, I just tossed that JUNK MAIL
in the trash when I got the mail. I recognized it right away. I can
smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!! ....I LOVE
THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to
GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll just
have to see what schemes could possibly be on the internet." The
article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE
AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well, the more I thought
about it, the more I became very curious. Why? Because of the way it
worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE
STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe a tough amount to reach, but
it was possible. I knew that I could at least get a return of $1,000
or so. So I did it!! As per the instructions in the article, I mailed
out ('snail mail'for you e-mail fanatics) a single dollar bill to each
of the five people on the list that was contained in the article. I
included a small note, with the dollar, that stated "Please Add Me To
Your List." I then removed the first position name of the five names
listed and moved everyone up one position, and I put my name in

position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so.... But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world-Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the mostdetailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name to your list". This creates a service out of this money making system and thus making it completely legal. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service. Make sure you include your name and address. I assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were

in slot 3", Just to add a little fun! This is all about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. Give a catchy description of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like..."Get one million dollars flooding in your mailbox in two days!"

You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This step added by Charles Reiley). Hello, This is exciting, isn't it?! While I'm on the list, just add a note saying "Please include extra money tips" with your name & E-MAIL address, and I will (FOR FREE) send you some neat methods to increase the money you will receive with this plan. Why?... Why not? I'm not a selfish jerk...I like helping out others. E-mail just makes it a touch easier and cheaper, too! After I drop off the list, I can no longer offer you this advice, obviously, but maybe someone else who gets my tips will offer and simply replace my name on this step number 9. Good luck and give this plan your all, it will definitely pay off! Like Mike said, HAVE FUN WITH IT!!!

10. (This comment added by Mike Lorincz) Hell dude, this is great, just send the money and wait like 1 week, then all of a sudden, BOOOOOOM! Mail flood full of dollar bills. Hahahah its great

Gary,

Thanks for your advice. I had already tried using a
shunt resistor and series capacitor on the output of
the Kendo, with no improvement in the appearance of
the TNC's lights. I can use "brute force" to get
the lights to look centered by forming a high-pass
filter with a small series cap and small shunt resistor
across the TNC input. But still no improvment in the TNC's
performance. As far as "common" connections go, there's
only one on the TH-79, on the speaker output.

Several nights ago I noticed an interesting phenomenon.
I was connected to VK8BBS and simultaneously monitoring
all packet messages. Another user was doing some kind
of long listing, and my TNC copied it perfectly. Now, if
those packets had been addressed to me, my TNC would most
likely have tried to ACK after three or four packets, even
though the BBS was still transmitting. I'm beginning to
suspect that the BBS pauses briefly between consecutive
packets, and that makes my TNC send a premature ACK because
it thinks the channel is clear. I've spent some time playing
with the RESPTIME parameter, but I don't think I've seen any
improvement. The search continues....

Gary.

>Anyone?

>Dave, n2fam
>(a Kenwood fan but also a Yaesu and Ten-Tec fan...)

Failing Kenwood supplying the paint (I somehow doubt they will be very obliging) here's what I do:

A local automotive supply chain here in Toronto (Canadian Tire) carries a large selection of car touch up spray paint. They carry OEM paints for most automakers' original colours.
The colour that I needed was a sort of grey with a hint of olive.
Of the 2 times that I decided to repaint a radio case I had little trouble coming up with a near match.

I spend a little extra time preparing the case before painting by sanding out any scratches and very carefully hammering out any dents. After painting, I oven bake the covers in the kitchen.
Of course, ventilate the kitchen during the bake and air it out afterwards.

Cheers,
Hugh Duff VA3TO Toronto

You cannot clear them. Look up "Masking" of memory channels.
Select the memory. Press and hold [FM] until [F] blinks. Then press [SKIP].

3953. re: New Toyota tacoma

Source record: 194693

I have a 95 4 Runner... similar hood and engine layout if you have 4WD...

The Toyota computer and the radio are not bothered by HF and VHF RF... I use an Icom 706 running 100 w 40 thru 6 meters, and 10 watts 2 meter... no problem.

Antennas are on roof (yes, it IS mighty tall when the 40 element is up)

The battery and computer are both on passenger side of engine compartment... I routed the 12 volt wiring behind the grill to driver's side, (AWAY from computer) and then found a
knockout rubber grommet right behind the accelerator pedal.... poked a hole in the rubber (to keep the cushioning for wires so they don't fray)

Did not need RF bypass capacitors, but do have some engine noise (I think it's fuel pump....) so must do grounding work yet... noise is a minor problem, and no big deal on SSB... however, CW DX is rough with engine running

This seems to happen to most all of the 440's that I know of. The problem is some deteriating goo used in the pll for mechanical stability. I forget the details, but go to ftp://ftp.kenwood.net/ and you can look at the service bulletin for this problem. The guys I know did not replace any parts as the SB suggests, but just scraped out the goo and did not replace it with anything.

Go to the Kenwood ftp site (ftp.kenwood.net) and get into the directory
/pub/Amateur/ASB_.txt_format and then get yourself copies of asb0973.txt
and asb0974.txt. These are the text versions of the files that address
this problem.

Specifically, asb0973.txt has the info for the problem described above. I
did not replace any parts but I did remove every one of them from the
board (a few at a time) and cleaned each part with trichloroethane and
also cleaned the board. I didn't put anything over the parts as suggested
in the bulletin, as I didn't plan on mobile operation (they reccomend hot
glue to improve stability in a rig used for mobile service.)

I also adjusted the VCO per the directions. I haven't had any problem since.

Actually Ron it is more than defending his purchase. Chris has never been wrong. He thought he was once but that turned out not to be the case. Once Chris makes up his mind he doesn't get confused by facts or expert opinions. "I said it, I believe it, that settles it." As long as anyone argues with him he will spew his nonsensical defense. Gary is on the right track, he doesn't have a clue, he doesn't want a clue so don't waste any more time or bandwidth on him. Maybe then he will go back to alt.mcdonalds and alt.politics.homosexuality. Yes Chris you do post to these groups; before you deny it you might want to check Dejanews it's quick, easy and there you are.

>of the sections(out of the four) for the 10 meter band.

yep. was a common thing to do at the time. and then there's radios like the
collins S-Line that run out of socket positions for the crystals since the PTO
only tunes 200 kHz.

>I need to know where I can find the proper crystals to fully install the
>10 meter band(for the remaining three sections that are empty).

just about any of the usual suspects found in the mags should be able to help
(ICM, Jan, Crystek, etc.). You tell 'em what you got and what you want to have
the crystal do and they make you one. (you might have to consult the operator's
manual for frequency specs if for some reason the maker doesn't have the
info handy). Tempo was pretty widespread, so the odds are that they crystal
manufacturers will be able to work with just the equipment type and the frequency
band you want to cover.

>I know ten meters is dead right now, but I thought it would still be
>nice to have it for future use.

only can be assumed dead. still hear stuff from time to time on 10..nothing wrong
with the occasional CQ...

From: Richard Abbot <abbot@pez.bell-labs.com>
Message-ID: <322EDE1F.6403@pez.bell-labs.com>
Source record: 194703

Some years ago, if you had a bit of cash saved up and
needed an HF vertical, you purchased a Hy-Gain 12AVQ
or 14AVQ. The 18HT Hy-Tower was for the truly
fortunate, but out of reach for most hams on a budget.

If cash was short, there were several sources for an
HF vertical that was a single vertical aluminum tube,
with an Air-Dux coil at the bottom. Tuning was done
by moving a clip on the coil.

Verticals have come a long way since then, with Butternutt,
Cushcraft, MFJ, and GAP now selling some pretty innovative
designs. I haven't seen anyone selling the Poor Man's
Vertical in a while -- does anybody still offer it?

Thanks and 73,

Rich

From: nitz@selectsa.com
Message-ID: <50n9co$91v@clarknet.clark.net>
Source record: 194709

Tony:

Keith has given you an excellent technical comparison of the 950SDX vs. 870. I have some (non-technical) experience with the 870 and here are my observations:

1. I think the 870 has an excellent receiver. It even works good on A.M.

2. Although I've never had a scope connected to the 870, I've consistently received excellent audio quality reports. I've had several amateurs on 75 meters check my signal for splatter: none was detected.

3. The computer interface is a lot of fun to play with.

4. The CW keyer, included with the radio, is awesome. If you're a CW fan, you'll also love the 50hz bandpass filter (yes, it really works, too) and the Speech Processing Auto-correlation Digital filtering. Makes it much easier to copy CW signals in noisy pass-bands.

5. I've actually had fun taking my 870 on portable and mobile excursions. While it's certainly not a "normal" mobile radio, it's great to have that option.

6. A good radio friend of mine uses the 870 on PACTOR with great results due in part to the excellent receiver filtering

I traded an 850S/AT in for my 870 and it was well worth the difference.

I've also heard a lot of happy Yaesu FT-1000 MP operators who choose it over the 870. Heard a few ICOM-775/DSB operators, too. The ICOM is much more expensive that the other radios, however.

Good luck with your selection. Be glad to answer any specific questions you might have.

>most versatile, and it seems to have a reasonably good reputation,
>although I have never owned a Yaesu radio.
>
>Any opinions on any radios, good, bad, or indifferent???

Just my 2-cents worth:

..The Yaesu FT-50R and Icom T7A cannot simultaneously receive on both bands.
The FT-50R has good audio.

..If you want extended Rx on UHF, don't buy the Kenwood TH-79A, it must be
opened up for the mod. The audio is also weak.

...The Icom Z1A is closeout priced right now, $299.95 at Jun's Electronics,
but the audio is very tinny. Maybe that's why it's being discontinued.

... The Alinco DJ-582 is also reasonably priced (about $310), and the audio
is great. Rig has extended Rx on both bands right "out of the box" but
sensitivity on the Airband and 450-470 Mhz is lacking.

....If I was buying today, I'd take a serious look at the new Icom W32A. It
has extended Rx on both bands, receiver is better than the Alinco, but the
audio is not quite as powerful. Has lots of memories and you can even program
your call letters into the display.

73 and happy hunting

Steve ...

I believe that you will find that the reason the S meter
reads higher is because the IF bandwidth is increased for FM
and there is more incoming noise to drive the meter up.

Source record: 194716

Hello All,

Field Day hastiness got me to connect my IC-2AT handie, equipped with a home-brew 12 VDC "adapter" to the 12 V bus with polarity reversed (yeah, I know - shoulda had a diode in the adapter to pop the fuse. Next time...) I'm finally getting around to thinking about repairs.

The "adapter" went (no biggie) and so did the 2AT. Anyone else been through this? Before I spend hours digging around and troubleshooting, if possible, I would like an experienced assesment of what I may be up against.

Thanks in advance for any help.

3977. Simple 2M mobil ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-05 00:00:00 UTC
From: "K.Bailey" <kbailey@riverstyx.com>
Message-ID: <322F4ED3.57BF@riverstyx.com>
Source record: 194717

What would you recomend for a 2 meter mobil radio for instalation on a motorcycle?
The number one concern is ease/safety of use; simple (and large) controlls are important! Don't need a lot of features, but need to be able to access repeaters with CTCSS. Higher power might also be needed, as the antenna won't be in as good a position as if it were on a car.
What would you suggest?
Thanks!

3978. FS: Tube Tester

HI THERE, well---interesting story. Actually, I chuckled at the end through amusement. Being honest and serious though--I estimate that either your radio has passed out or once you moved all your nice electrical applicances and items from top floor to first floor that toppled out your chances of getting out on your HT. Never bank on an empty room--example, we were moving office equipment and furniture to 14th floor of building and I turned on my shortwave portable when the office was empty and got splended receiption; however, once the office was filled and equipment up and running I barely got anything. In fact, if I decide to transmit on my HT at office (which could be similar to first floor apartment at home) I must stand by the window and do get out to repeaters close by.

Now on with your crisis!! The higher up the better it is for radio transmissions; however--the main thing is the higher the antenna. Since your landlord is aware of your hobby would you be allowed to prop a 5/8 wave antenna up on the roof of your apt.bldg. and run the feedline into your apt.? You would get out like gangbusters then!!! I think you mentioned that you tried another HT just to see if you were getting out, well if that HT was doing fine why not invest on one like that?? Back to the 202--the life of 202s should be longer than what some are actually getting out of them and I have heard people with problems and took them back to Radio Shack and was given a new 202. Have you tried your 202 in another area outside your apartment and the area lately??

One last thing here---Stan KE4PKB on Shelby Drive, Augusta, Georgia, is a Radio Shack 202 expert and could help you very much on your crisis. I don't know his e-mail but if you write a note and mail it to him along with your e-mail he will most likely be on the computer to help you out. You will locate his full name and address in the QRZ database.

Best wishes and good luck!

I was the victum of a break in. They got the control head / front panel for my Kenwood TM-742. Kenwood will not sell a replacement control head. They insist it is cheaper to buy the whole radio.

If you have a control head for a TM-742, TM-942 or TM-642 I would be interested in working a deal.

Thanks,

Bill Harwood

Not Really! The 736 should put out 25W on 6. The older 726R put out
10W. The 736 1.2Ghz module is around 10W out.

Take a look at the FF-800 from FF Systems, they have a Web site at
http://www.rollanet.org/~joeh.
I am looking seriously at their controllers. Amongst other things, their DVR board can have like 72 minutes of storage and can be shared by 3 controllers.

The Yaesu FT-8500 has an Auto-Mute function. Which when activated,
will either mute the other side of the radio partially or completely
or not at all... your choice.

Use a Mirage D15 amp. Provide about 15 watts out for 3-5 in. Has PIN diode
T/R switching. Two of these back to back with the Tekk gets us a 30ms TXD.

The advice I was given was to use the PTT signal from the modem/TNC
to switch the PA. In other words, connect both tx/rx switches to the
PTT line on the modem and set your TxDelay for the slower one (probably
the radio, unless you're using a relay to switch the PA). This way,
by the time the radio has started to transmitter is stable and on
frequency, your PA should also be ready.

I haven't tried this yet, but it makes sense.

regards,
Dean.

I would like to buy a simple 2 meter mobile for an old car of mine. Don't want to spend a lot on this since this car is hard to secure. Something of the Yaseau Memorizer era would be ok but does need to have PL.

Also interested in 450 and 220 gear for mobile or base use.

When I plug my NC-60B battery charger into my FT-50R
the voltage reads 15.2 Volts. O.K., but it charges my 9.6 Volt
FNB-41 battery (5 Watt battery) to over 10.6 Volts (via the internal
dC display).

Is this correct, or is it overcharging my battery?

Help!

> who can help me ? Thanks !

Dirk,

French is very poor to translate things like that. Good Lord
"Hard and Soft trunked radio systems" =

It's a nighmare to translate. Too elliptic, I don't even
understand what that means exactly: Hard, Soft?, Which trunk
Trunk like car or like trunk lines..--..

Frequency efficient could be translated by =

"Efficace en frequence" but that's poor,
if you are talking about Spectrum efficiency
"Efficace du point de vue spectral"
"Efficace en occupation spectrale"
etc..

Good translation can't be made out of context. This
in French is called "Mot =E0 mot", (word for word)
and it means ... bad translation.

4008. Yaesu FT-50R, crackling noise on UHF transmit

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-06 00:00:00 UTC
From: "Gary L. Crum" <crum@xmission.com>
Message-ID: <32307D32.296B@xmission.com>
Source record: 194585

Has anyone else noticed a rustling, almost wind-noise-like crackling sound on the audio of the FT-50R, when transmitting on UHF (70cm) frequencies? This problem occurred intermittently but frequently on my friend's 50R, so he sent it back and got a new one. The new one came today, and unfortunately it exhibits the same problem. The audio when transmitting on VHF (2m) frequencies is excellent -- there has been no sign of the crackling sound on VHF transmissions.

I see a description of a crackling noise problem in a past news article, now in the http://members.gnn.com/hca/ft50/problems.htm web page, from rocket@intercall.com on Fri, 28 Jun 1996, but I don't know if this is the same problem -- probably, but that article did not say that the crackling happened only when transmitting on UHF frequencies.

We're wondering if the problem exists in a lot of FT-50R radios, or just a few like these two that we've seen (serial numbers 6G050784 and 6G050797). The noise is not that hard to hear, but low enough in level that it is not overwhelming.

I should probably put a recording of the noise in a web page, huh? Oh well, it's not convenient to do that now. Maybe later.

4013. Ham radio: HTX-202

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-06 00:00:00 UTC
From: Steve Turner <stevet@mail.utexas.edu>
Message-ID: <3230FA07.450C6ADD@mail.utexas.edu>
Source record: 194590
Cross-posted to: austin.forsale,rec.radio.amateur.equipment,tx.forsale

For Sale: 2-Meter Amateur VHF-FM Transceiver.

Realistic HTX-202 'handy-talkie' portable. Like new, with box &
manual. No scratches, never dropped. Very tight, selective receiver.
Selling because I'm moving up to a dual-band 2m/70cm rig.

Features:

o Receives & transmits 2m amateur band (144.0 - 148.0 MHz)
o Ni-Cad battery pack (7.2V 600mAh) with charger (included).
o Multifunction scanning - frequency steps selectable.
o Touch-tone (DTMF) squelch.
o CTCSS subaudible tone encoder *and* decoder.
o 6.0 watts output @ 13.8V
o 2.5 watts output @ 7.2V
o 1.0 watts output on low-power setting
o Direct DC operation possible. 13.8 VDC power jack mounted on top.
o True FM transmit for superior audio and excellent performance on
packet.
o 12 memory channels, 3 priority channels and 1 calling channel.
o Alkaline battery case included (requires 6 "AA" batteries).
o Programmable power-saver extends battery life.
o Store up to 5 15-number DTMF sequences for selective calling or
autopatch.
o High/low RF power switch.
o BNC antenna connector - comes with heavy duty 'rubber duckie'
antenna.
o Belt clip and wrist strap.
o External speaker and microphone jacks.
o Internal backlighting for LCD display - choose 5 seconds or ON/OFF.

Price $150.

I also have the Realistic speaker/mike with spring clip on the back
that I will throw in.

Please e-mail me if you are interested.

I built the 2m version a couple of years ago. I found it fairly easy to put together, except for soldering the power transistor. You need a good soldering gun to do that, and a brave heart! Soldering in all of the programming diodes is a real bore, but not difficult. I found one of the variable caps went bad after the first time I adjusted it - had to order a new one from Ramsey.

After getting it all put together it worked reasonably well, though the audio was just so-so. Even with a Ramsey-supplied mod, the RX audio popped fairly loudly after letting go the PTT.

All-in-all, I felt the kit was a reasonable deal. Not nearly up to Heathkit standards, though! But why would you even consider the Ramsey kit (for 2m at least) when TenTec has a full-featured kit that actually costs a few dollars less? (after buying a case and mic for the Ramsey) The TenTec radio has memories, a display, an optional 30w internal amp, and a mic and nice case are included.

can anyone help me find a pair of knight-kit c-100 walkie talkies from the early 60's??? they were blue three transistor 100mw units.

also looking for a knight "span master" 4 band short wave receiver from the same time period.

thanks
bobby

4024. FT-50 Pop

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-06 00:00:00 UTC
From: Bob Eastwood <eastwood@nrcdec.nrc.state.ne.us>
Message-ID: <32305A91.64E8@nrcdec.nrc.state.ne.us>
Source record: 194601

I just purchased a Yeasu FT-50. I like to wear walkman style headphones with my hand held portables when in public.

The problem is the FT-50 does not have an earphone jack, only a speaker mic jack that will not work with headphones. So I purchased the Yaesu CT-30 Sperker mic adaptor that fits on the side of the radio. This adaptor is to be used with two connector speaker/mic's or headphones. This allows regular headphones to be plugged into the unit. The big problem is everytime a station breaks the squelch a LOUD pop comes through the headphones first and hurts your ears.

I have used these headsets with other ht's with no problem. I am thinking of returning the rigs because of this problem.

Any suggestions???

We have one on the Nebraska Emergency Management Emergency Communications Command Post. This is a Winnebago motor home filled with radios. We use a SGC antenna tuner mounted on the wall in a closet hooked up to the SGC 303 HF antenna on the outside, and a Kenwood TS-50. The antenna is right on the outside of the unit opposite the tuner on the inside. We did have a problem going down the road and the HF antenna moving caused the tuner to try to keep retuning. After we got the little box, that may be included in the later units, that allows you to stop this retuning and lock the tuner at one place it works fine.

The antenna is mounted on the side about 2 feet below the roof. This is not the best place, the top of the roof would be great, but the antenna would hit overpasses and bridges. So this was a good compromise.

Good Luck.

Bob Eastwood

> bernie

I bought the same adaptor to use with mine, except I like to use the walkman style headphones while out in noisey areas.

I HAVE A PROBLEM WITH IT.

It puts out a loud pop each time the squelch breaks. Does yours do the same? Know of any fixes for this? I am thinking of returning my unit because of this.

Other than that it is a great little rig.

Hy-gain bought through outside vendors. I
am the Communications Manager for the Nebraska Emergency Management
Agency and we have several of them and would like to buy a couple more.

Hy-gain has a replacement for this product. It is the model 19-PD. Is uses
a fabricated braided rope which has conductors woven directly into it. It
is highly flexible and very lightweight. I have not seen one directly,
just pictures of it.

Good luck,

Real simple Phil, do you expect to do HF digital modes? If so get the
KAM it is bigger because it has a KPC-3 and an HF modem in one package.
OTOH if small size is important and you do not intend HF then the KPC-3
is the way to go. If I can help get you going drop a note.

My choice - Yaesu FT-51R. Has simultaneous dual receive and the alpha display is very nicely done. I also have the FT-50R and like it, but I prefer the FT-51R. If you want really wide band receive, then the FT-50 would probably be a better fit.

regards, Don (KE4KYO)

I thought that perhaps it might also be related to a difference in
"linearity" between the AM detector and the FM product detector. You
are correct, thought, the bandwidth for even narrowband FM is twice
that of a typical SSB filter.

Cleve, thanks for the report on the new MFJ six meter rig.

I was halfway considering buying one last Spring for the start of the 6 meter sporadic-e season, but lucked upon a used Icom 560 for a little over $300. It has ten watts, SSB/CW/FM, a dual VFO for repeaters and three simplex-only memories. Its memory is also "volatile", but this has not been a problem so far.

While it does not have the features of later radios, it still is an excellent radio in many ways, and I like it very much. While used VHF all-mode gear is hard to find, I've found it does show up from time to time in Packet bulletins and the local West Coast 40 meter swap meet.

If you did not buy the optional CW board for your MFJ, I would suggest buying it. I've made several cross-mode SSB/CW contacts on 50.125, with "big guns" who could not copy my puny SSB signal. (Curiously, despite the influx of Codeless Techs, not too many are on VHF SSB, and most ops can copy CW reasonably well.)

73 and hope to catch you on 6 meters. --Leigh/KM6JE in DM04.

4042. Re: Color Printer?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-06 00:00:00 UTC
From: wmkresl@townsquare.net
Message-ID: <50orhi$5d7@herald.concentric.net>
Source record: 194797

I have had an HEWLETT-PACKARD HP660Cse for the last eleven months. It is a GREAT printer for all the jobs that my wife and I have thrown at it. It has dual cartridges, unlike the DJ600, which I would avoid for the mere fact that you have to MANUALLY swap the carts to do any color/B&W printing. That would get old very fast! For the small diff in price (660's are now about $239), its not worth it to scrimp. WEB page printing is a good example of mixed modes that I wouldn't want to print with the 600. Even color images may have black areas or text in them.

BTW, the paper handling on these printers is VERY good, having NEVER had a paper jam or mis-feed of any kind. Output is EXTREMELY good on HP's GLOSSY PAPER to the point of being jaw-dropping good. HP inks are far superior to other manufacturers for depth of color, JET BLACKS and color fastness. They have been making INKJETS for a LONG time.

"OTHER" printers lose 50-75% of their output due to fading within HOURS of a printjob. Or look CARTOONISH, or faint in comparison. Some printers lay down so much ink that it POOLS on the paper. Also, other printer's output is still subject to smudging WEEKS AFTER they are printed! And those same printers print TEXT at the BLAZING speed of 6pages PER HOUR! You could write faster then that. This is the kind of OTHER junk they are selling. If its not printer problems, its warranty problems with them. Follow the printer newsgroups for awhile, and you'll hear the horror stories. HP colormatching is very good as-is, and very little "diddling" is required for color prints.

The HP 680/682 series is the same printer as the 660 except with modified mechanics to allow a special HP BANNER PAPER. Carts are the same, but the printer costs start at about $300. Also, the warranty has been DECREASED to ONE YEAR with these models. My HP660 has a standard THREE YEAR WARRANTY. Hurry, they are going very fast!

The 600 Series has a smaller footprint then the 800 series, and it is quieter in my opinion.

I think for the money, the HP660C (or Cse -model that includes some extra promotional software and sample paper) represents the best bang for the bucks. Resolution for both 600/800 series is the same. Both have HP's COLORSMART software technology, and both use the SAME software driver (I am using version 8.0 now). These printers also do MANUAL-FEED DOUBLE-SIDED printing (both BOOK and PAD styles) via the driver software.

The HEWLETT-PACKARD line of printers represents true quality and value
with top-notch service and documentation for any of the models you chose.
The "OTHER" color printers are mere flimsy TOYS in comparison, in my opinion.

Pick up a ten-pak of HP GLOSSY paper for $10, and take it to a dealer
(along with a disk of images/text of your choice) and try sampling
each printer for yourself like I did.

Additionally, with ANY color printer you chose you will need to purchase
a BI-DIRECTIONAL cable that conforms to the IEE-1284 specs (about $25).
Your computer's LPT parallel port should have the bi-directional mode
already, either setable by on-board jumper OR as ECP/EPP port modes
set in your SYSTEM BIOS's CMOS setup. An old $2 cable WILL work, but
not as well.

For printing large/colorful images, plan on having at least 20 or MORE
MEGABYTES free hard drive space to adequately do the printjobs without
a lot of disk thrashing.

I don't work for HP, just a very satisfied customer with MOUNTAINS of
printouts that my printer has churned out. And I ALSO replaced MY
PANASONIC KXP-1124 printer with the HP660Cse! You won't regret it!

Cheerio,
Wm Kresl

I have a Kenwood TH26AT Handheld VHF (fully modified to transmit/receive
100 - 200 Mhz (GREAT SCANNER) with following accessories:

2.5w Battery woth charger
5.0w Battery with desk-top charger
5/8 telescopic antenna
rubber duck antenna
extneded speaker mike
hard leather case
manual

Price: $350.00 Canadian dollars

4044. HELP: Collins parts info

Newsgroup: rec.radio.amateur.equipment
Date: 1996-09-06 00:00:00 UTC
From: eb5agv@amsat.org
Message-ID: <842008733.17667@dejanews.com>
Source record: 194799
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Thanks for reading this message.

As title says, I need information of some Collins parts:

-Microphone jack for 32S-3
-2A and 4A fuses for 516F-2

What I want is a description so one friend of mine in USA could buy them for me.
I don't need Collins part numbers, but a description or commercial reference for
them (as 'BNC connector' or so).

Please, e-mail to: EB5AGV@AMSAT.ORG

THANKS!

73 JOSE - EB5AGV / EC5AAU

Bill Stewart <stewart@peganet.com> wrote:

>The much bally-hooed ICOM IC-2350H dual band rig has a major bug that
>ICOM refuses to admit.

Icom IC-2700H does not. (I have one). Icom IC-2350H does not (I have one.) Yaesu FT-8500 does not (my friend has one). Standard C550 handheld (just like C558A, I have one) does have a Mute Function. Lots of transceivers do not have this function. In your definition, these radios all have bugs.

However, what is a bug? A bug is either an unwanted side effect, or a function does not do what it is supposed to do. In this case, the side effect is having the sub band audio coming out all the time, does not respond if the main band is in TX mode. As I said, many radios have this effect. This is certainly unwanted for a lot of us, and would be nice if they put the option in to mute it. I personally hate this inconvenience, since I access a lot of cross-band repeaters while dual monitor them. Imagine the strong feedback if I forgot to turn down the volume. Did I blame Icom for it? No I didn't. I wish they would have put it in, as well as some other fancier functions. I know in the older days, many standard functions are not even around.

I have seen you posted this strong bug articles at least 3 times, all talking about this subject, and how Icom has not admitted to their bug/problem and caused you to be upset about it. I have responded twice to the first 2 I have seen, trying to explain the difference between lack of feature and bug; they are not the same, and also differ in degree of seriousness in case of annoyance. You probably have not listened. (I think that is you, if it's another poster, I apologize.)

I also recall earlier articles reference to the Mute fuction presented in the manual, which you thought it wasn't working. Of course that function is defined as muting subband audio while main band audio is present (for receiving), as clearly shown in text.

I do not understand your ongoing/nonstop posting of same subject again and again. I do not work for Icom, and have any interest in Icom myself, and really do not care. I personally have a few things I do not like about Icom, e.g. their poor intermod rejection and no fix available. I just want to set the record straight in this case, as many causal readers might think the IC-2350H has serious bugs. (In this case, my interest will be my resale value of mine when I want to sell it :).

>The radio fails to mute to subband while transmitting on the selected

It simply is NOT designed to do it. It doesn't do it. It does NOT have to FAIL to not do it. Your word choice is deliberately strong, IMHO.

>band. You thus end up re-transmitting whoever is talking on the other
>band through your mic without their knowledge.

Your claim is if they design a dual band radio, they should think about this, right? Since someone has already suggested, just treat it like 2 radios. You are in complete control of your environment, sometimes your machine can do it for you automatically, sometimes they don't. It's not a major design fault if it is lacking in some level of automation.

>Granted, the ability to receive while transmitting is necessary if the
>rig is going to be used as a cross-band repeater. However, that
>function is NOT DOCUMENTED BY ICOM and could easily have been enabled
>when cross-band repeat is enabled, certainly a rare event.

That function is documented by Icom, but not included in the manual. The addendum you obtain from your dealer, is certainly written and printed by Icom first. It is provided by Icom, it is not hacked by someone accidentally.

>ICOM's super sophisticated, high tech solution ? Turn down the volume
>on the subband when transmitting, and then remember to turn it back up
>when done so you can hear the other band again.

What would you think they can do? Do you know how much it costs to get a new firmware written and programmed into new CPU and replace the SMD cpu in your radio? If you really think your radio is defective, and Icom is denying it, why don't you take it to court, instead of posting here over and over again?

>My recommendation as an owner of the rig ? If you can live with having
>to make manual adjustments to the radio whenever you choose to transmit
>on one band or the other, it's a fine rig. But this lack of such a
>basic function as muting receive during transmit gives it my
>"Unacceptable" rating.

This is the only type of comment I think is okay. "unacceptable" is very personal, and has little specifics for guideline. However, there is common understanding of the definition of bugs.

Also, you have put "poor review of Icom ic-2350H" on the subject. I do not see a review being written here. You have talked about one single lack of feature so far.

I am not sure if you understand the nature of the claimed problem. If a radio does not have an option to mute whatever, it is a lack of feature. Not a feature, not a bug, it is a "lack of feature". Many many mobile rigs (unlike handhelds) do NOT mute subband audio while TX on the main band. Not just Icom, according to my friend who owns Yaesu FT-8500, top model dual band mobile, it does not either.

>Standard Engineering Practice. There is never anything wrong with the

>not what they expected and declare that the market is diminishing.

How come you know so much about Icom? Just how do you know these things? :)

>You'd think if they tested the thing they would have noticed. Hmmm.

They would have noticed it in the last generations of mobile transceivers.

>Maybe I on to something??? :-)

Because you believe what the original poster said. However, he has exagerrated the situation, and has been posting this many times already.

Thanks to all who responded...The best alternative that has been suggested
so far (IMHO) would be the soon to be released Comet SMA501. I close
relative to the Comet "Miracle Baby," but with an SMA adapter. It is
apparently going to be available very shortly from what I have been told
and will range in price from $27-30. Anybody with more information on
this antenna, please let me know.

>mobile that DOES NOT have wide band Rx due to intermod problems
>in my area.

I own an IC-2700H. It receives from 136MHz to 174MHz and 400MHz to
479MHz. From stock it receives on within ham bands but the wide band
receive is only a CPU function mod. by pressing a few keys during
power on. This radio has excellent functions, I love it; but it is a
poor performer in intermod rejection. I currently use one DCI
bandpass filter on each band to reduce intermod problems. It works
and get rid 90% of the intermod.

The better dual bander in intermod rejection I have heard/read are
Alinco 610, possibly Yaesu FT-8500, and not too sure Standard C5712.
If you absolutely want better, try single band ones like Yaesu
FT-2500M, Icom IC-2000H, IC-28H, and their UHF counterparts.
If you still want the functionality of the Icom rigs, the newer
IC-2350H and IC-2710H have attenuators built in on the squelch knobs.
Although hardly a good solution, but it does reduce the problem when
use (turn pass 12 o'clock).

Good luck.
